Preexisting Conditions: Medical History/Concurrent Conditions: Allergic reaction to bee sting; Depression; Pre-diabetes
Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021263134
Write-up: Dizziness; numb tongue; difficulty swallowing; difficulty breathing; inability to move arms and legs; This is a spontaneous report from a contactable consumer. A 44-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution

for injection, lot number EN6199 and expiration date unknown), via an unspecified route of administration in the left arm on 09Mar2021 at 15:00 as a single dose for COVID-19 immunization. Medical history included depression, pre-diabetes and known allergies: bee stings. Concomitant medications included loratadine (LORATADINE), metformin (METFORMIN), paroxetine (PAROXETINE), and bupropion hydrochloride (WELLBUTRIN), and "Mul". The patient had no other vaccine in four weeks. On 09Mar2021 at 15:15, The patient experienced dizziness, numb tongue, difficulty swallowing, difficulty breathing, and inability to move arms and legs. The patient had no COVID prior vaccination and had not tested post vaccination. Therapeutic measures were taken as a result of the events which included Epinephrine, ER treatment, and Prednisone. The outcome of the events was resolving. The events resulted in: Emergency room/department or urgent care, Life threatening illness (immediate risk of death from the event).

CDC Split Type:
Write-up: Pfizer-BioNTech COVID-19 Vaccine EUA I had no symptoms after the first Pfizer vaccine. On Tuesday, March 23, 2021 I had the second vaccine and had flu symptoms the next day with body aches and fatigue. I felt better the day after that-Thursday. This morning, Saturday, as soon as I got out of bed, my face burned and turned bright red. I looked like I had a sunburn. My arms, especially around my elbows turned an angry red. They didn''t burn as badly as my face. Around an hour later, the redness subsided, but my face still feels hot. I don''t feel like myself and am taking it easy today. I want to report this so you are aware of the reaction. I take no medications and am extremely healthy. My last vaccine was in 1976.

CDC Split Type:
Write-up: Night of vaccine felt heaviness on chest - using elliptical machine as usual and felt out of breath very quickly within 15 minutes. Normally do 30 minutes and can speak through it. Just thought I was tired. Overnight joint pain significant in knees, fingers and shoulder blades. Husband told me I was moaning throughout the night and turning from side to side. Got up to go to the bathroom once and head felt foggy. Morning got up as usual and quickly became light headed. Started to black out to the point where sitting down and putting my head down didn?t help. Was blacked out and yelled for my husband. Husband carried me to the couch what I was saying he

thought I was hallucinating. Began to have whole body trembling - not necessarily chills just trembling. After about an hour subsided. Blacking out lasted on and off throughout the day. O2 stats between 91 and 94 throughout the day, fast heart rate 90+. No fever. Stayed in bed all day, barely moved. Restless and couldn?t get comfortable - very bad headache. Going in and out of sleep. Treated with Tylenol arthritis and ibuprofen. Drank water and some hot tea. Very hard to even drink anything. Next day felt like I had been sick although by 5pm seemed to be back to baseline.

Diagnostic Lab Data: Test Date: 20210310; Test Name: heart rate; Result Unstructured Data: Test Result:increased; Comments: intermittent heart racing for 3 more days
CDC Split Type: USPFIZER INC2021293946
Write-up: peripheral neuropathy in face; Covid-like symptoms; allergic reaction immediately after vaccination; dizziness; weakness; tingling; increased heart rate; brain fog; fatigue; chills; muscle and joint soreness and stiffness; muscle and joint soreness and stiffness; muscle and joint soreness and stiffness; muscle and joint soreness and stiffness; swollen lymph nodes; intermittent heart racing for 3 more days; This is a spontaneous report from a non-contactable consumer (patient). A 66-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN6204), via an unspecified route of administration, administered in the left arm on 10Mar2021 at a single dose (at the age of 66-years-old) for COVID-19 immunisation. Medical history included mild asthma, arthritis, known allergies: react to some food, insect bites, and had a bad reaction to shingles vaccine. There were no concomitant medications. The patient had no other medication in the last two weeks and no other vaccine in the last four weeks. On 10Mar2021, the patient experienced an allergic reaction immediately after vaccination which included dizziness, weakness, tingling, increased heart rate - lasting approximately 2 hours; followed by COVID-like symptoms of brain fog, fatigue, chills, muscle and joint soreness and stiffness, peripheral neuropathy in face, swollen lymph nodes and intermittent heart racing for three more days. The patient was not COVID tested post vaccination. No treatment was given in response to the events. The patient was recovering from the events. No follow-up attempts are possible. No further information is expected.

Diagnostic Lab Data:
CDC Split Type:
Write-up: 1. First: Rash between breasts appears that evening. It is very very itchy and red. There are five raised hives which are white and dime-sized. They appear almost to have a pinhead sized pus in them. At the 36 hr mark, it remains the same in discomfort, but there are more hives and it has spread out by three inches across the chest and is halfway up to the neck. The rash does not improve or spread further and remains the same at the 4.5 day mark today. 2. Around day 1.5 or 2, a mucusy film fills throat making it necessary to constantly clear my throat in an almost violent way order to feel comfortable. It feels like there is lots of post nasal drip in my throat, however, I have completely clear sinuses. Sometimes this means coughing though I would not say I have a cough. 3. I need to use my inhailer in my car on Sunday, day 3.5 to breathe deeply. This is very unusual. I have shortness of breath and deep wheezing more than usual. 4. Day 3, I realize I am very very tired, which I had though was just because I have been busy, but with alight myalgias starting, now recognize that the fatigue is abnormal. I feel like if I let my eyes close at 3pm, which they feel like doing, I would fall asleep. This continues day 4. Ironically, I have trouble sleeping. .. 5. Day 4.5, Myalgias, see above. And skin also feels fender in spots. .. 6. Today started a general unease, day 4,. I had this with Covid. It is hard to explain. The feeling of just "bad" -- an experience I have only ever had with Covid. Like a dread mixed with a fear with a stomach bug. Maybe that helps. 7. Day 2 on -- Headache off and on. A tension headache. Could be from not getting enough sleep but it was persistent throughout the day yesterday and today.

Write-up: She got the vaccine, did have pain at the site and thinks it was the first day at the end of the day. When she laid down she could feel it and also on the 2nd day at night. On day #2 she felt like she was coming down the flu. She had skin sensitivity, chills and a fever, extreme fatigue and her nose was running. These symptoms lasted all day long and into the evening. By the third day she woke up and was fine. She was a little tired, which lasted for about 3 more days, but minimal. She cleaned an area in her kitchen and came across a detox that she had taken (herbal formula), and she thinks when she first found it she took it, and the next day she took it as well.

CDC Split Type:
Write-up: Patient received second dose of Pfizer mRNA covid-19 vaccine on Thursday, 4/1/2021 at 2:25pm. After administration, patient reported tightening in her chest and was negative for difficulty breathing, change in heart rate, and had normal cognitive functioning. After approximately 5 minutes of being observed, the patient reported further tightness in chest and started feeling short of breath, but was negative for change in pulse or cognitive functioning. At that time, the pharmacist provided the patient with dexamethasone 4mg, which was self administered, and after 5 minutes hydroxyzine 10mg when the patient''s symptoms did not resolve. An Epipen injection was administered around 2:35pm by the pharmacist after the patient''s tightness in chest worsened despite dexamethasone and hydroxyzine and the patient was feeling cold and started shaking uncontrollably. 911 was called at that time and EMS services evaluated the patient around 2:45. The patient was transported to the emergency department at

the local hospital around 2:50pm.

Write-up: 1/19 vaccination 1/20 At about 3pm, I had symptoms of having my period. I started having really bad pain on lower back, I could not stand. I could not pick my baby up. I called my husband to come home. The pain was extremely bad, I could not walk. I took Ibuprofen, called clinic and they said you should call CDC or wait. I went to bed and around 6am I felt like I had to go to the bathroom. Walking back, I went to sit on edge of bed, I was in so much pain. I started feeling so bad, I fainted. When I woke up, my husband was asking me questions. We called 911,

took vitals, transferred to ER. Gave Ibuprofen and did ultra sound. They discharged between 11-12. They said to follow up with PCM. It was so scary. Symptoms lasted for 4-6 days after. It became better each day. *still have not had second vaccine

CDC Split Type: USPFIZER INC2021295228
Write-up: weak; lightheaded; My blood pressure low 80''s to 90''s over 40''s to 50''s all thru night; dehydrated prior to this admit; shaking; chills; severe headache; right mid and low back pain; high fever up to 103 degrees; Not able to get out of bed except to get to nearby bathroom; This is a spontaneous report from a contactable nurse (patient). A 74-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), first dose at the age of 74-years-old via an unspecified route of administration, administered in arm left on 05Mar2021 15:30 (Batch/Lot Number: EN6200) as single dose for covid-19 immunisation. Medical history included anal cancer (h/o anal cancers/p chemo & RT2013), hypertension, hypothyroidism and new fe deficiency anemia dx during this admit from an unknown date and unknown if ongoing. The patient''s concomitant medications were not reported. The patient has known allergies to Ampicillin, clindamycin, trilafon, imipramine. The patient reported that 4.5 days after 1st dose of Pfizer vaccine on morning of 10Mar2021 09:00, the patient woke up with shaking chills, severe headache, right mid and low back pain, high fever up to 103 degrees within 1/2 hr of onset and not able to get out of bed except to get to nearby bathroom to use toilet when needed. The patient took Tylenol 500 mg up to 5 doses by 10:00 am of 11Mar2021 when fever would not abate; the patient was weak and lightheaded on an unspecified date and since lived alone called a number to take her to ER. On an unspecified date, her blood pressure was low 80''s to 90''s over 40''s to 50''s all thru night and 1000 more mg of Tylenol was given at 4:00 am and fever then lowered to 99 or 100. Full infectious work up negative for bacterial sources including abdominal and pelvic cat scan, abdominal ultrasound, CXR, urine culture, she received 2 1/2 liters of IV fluid and IV Ceftriaxone and Flagyl in ER. In case bacterial cause which was not found including blood cultures, due to her BP still not improved by 5:00 am as she was dehydrated prior to this admit, she was admitted on medicine floor for 2 days. The patient underwent lab tests and procedures which included abdomen scan: unknown result on an unspecified date, blood pressure

measurement: low 80''s to 90''s over 40''s to 50''s all thru night on an unspecified date; still not improved on an unspecified date, body temperature: high fever up to 103 degrees on 10Mar2021; 99 or 100 on an unspecified date, chest x-ray: unknown result on an unspecified date, culture urine: unknown result on an unspecified date, sars-cov-2 test: negative on 10Mar2021, ultrasound abdomen: unknown result on an unspecified date. Therapeutic measures were taken as a result of the events which included IV, fluids, 1 dose of 2 different IV antibiotics (Ceftriaxone and Flagyl) and Tylenol. The patient was recovering from the events.; Sender''s Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Allergies: penicillin
Diagnostic Lab Data:
CDC Split Type:
Write-up: She received her first COVID vaccine on 2/24/2021 and her second COVID vaccine on 3/24/2021. She had some arm soreness following the second shot. On the morning of 3/26/2021, she awoke with fevers, chills, body aches, diaphoresis and shaking. Her symptoms minimally improved with Tylenol. She recorded her temperatures with the highest being 102.7 F this morning. She reached out to her hematologist who recommended coming to the ED. On admission she was noted to be pancytopenic with neutropenia ANC 100 and febrile 102.7F. CXR was clear, UA showed no pyuria, and CT chest/abd/pelvis was unremarkable. She reports she did not develop diarrhea until she arrived at the hospital. C.diff testing was sent and returned positive. Although fevers have been reported up to 7 days post COVID vaccination, I am not aware of

reports of it causing pancytopenia. It is not clear if C.diff or other infectious etiology contributed to her pancytopenia or if her pancytopenia is a result of severe infection. Considering she did not have any recent insult that would have induced the C.diff infection (last chemo in Jan and no recent antibiotic use), no diarrhea prior to admission, and no CT evidence of significant colitis, I suspect her profound pancytopenia is what caused her C.diff to flare. Unsure to what caused the pancytopenia, considering the vaccine.

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: angioedema; blistering on arms; swelling; arms continues to have flaking; arms continues to have blistering; welts on arms; A spontaneous report was received from a Health care professional, concerning a female patient of 37 year age, who received Moderna"s COVID-19 vaccine and experienced angioedema, welts on arms, blistering on arms, swelling, arms continues to have flaking, arms continues to have blistering. The patient"s medical history includes chronic idiopathic angioedema, paroxysmal atrial fibrillation is noted. Patient has known allergy to benzyl peroxide. Concomitant product use includes cetirizine, famotidine metoprolol, epinephrine were provided by the reporter. On 28 DEC 2020, prior to the onset of events, the patient received their first of two planned doses of mRNA-1273 (lot number unknown) via intramuscular route for COVID-19 infection prophylaxis. The treatment given were Cetirizine 10mg BID for angioedema, Famotidine 20mg BID for angioedema,2 doses of epinephrine 2 hours apart with no relief for angioedema, triamcinolone for welts and blistering, Benadryl (Diphenhydramine) 25mg-50mg for angioedema noted. Action taken with mRNA-1273 in response to the event was unknown. The outcome of the events such as angioedema, welts on arms, blistering on arms, arms continues to have flaking, arms continues to have blistering was considered to be not unknown at the time of this report. The outcome of event swelling considered to be resolved at the time of report.; Reporter"s Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

Current Illness: Quadraparesis due to neuromuscular juctional disorder Neurogenic bladder Hemrrhoids Basal Cell Carcinoma shoulder
Preexisting Conditions: Quadraparesis
Allergies: Sulfa Drug - rash
Diagnostic Lab Data: None
CDC Split Type:
Write-up: Wife reported that no side effects from vaccine noted until 3/16/2021 when patient had arm and back pain and wanted to go back to bed and she noted he was extremely sweaty at that time. He was lifted back to bed and was reportioned several times because he could not get comfortable. She went to get him a drink from the kitchen and heard a guttural sound and rushed back to find him unresponsive and blue in color. She called "911" and patient was dead upon arrival (and a DNR) so the Medical examiner arrived and pronounced him dead. She states sx

started at about 4pm and he was pronounced dead at about 5pm. Medical examiner determined a heart attack cause of death. The family not sure that the vaccination had anything to do with death but wanted it to be reported.

Diagnostic Lab Data: None
CDC Split Type:

Write-up: Slight pain and swelling at injection site. Body ache and slight nausea and exhaustion. Worth noting that I was so excited about getting the vaccination that I could not sleep the night before. I blame the exhaustion and later headache on lack of sleep, food, and caffeine. I went to bed early and took acetaminophen and slept well. In the morning a shower, coffee and breakfast and more acetaminophen makes me almost as good as new.

CDC Split Type:
Write-up: I started shaking uncontrollably and shivering that lasted about 3 hours. I could not stop shivering, even though the house with much warmer than usual. I had shooting pain all over, especially in my shoulders. I could not move, or even reach for my water glass, without extreme pain. It felt like nerve pain, muscle and joint pain. I am very active, strong and healthy. When I walked to go to bed I was in so much pain that I could not stop moaning and saying Oh my god, oh my god, (that?s not like me ? I have a high tolerance for pain and consider myself stoic) and I was shaking so hard I thought I was going to have a seizure or something. I was very tired and slept through the night. This morning I feel like I have the flu ? headache, body aches, fatigue. Thank you.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Diarrhea. 4/4/2021:More than 2 or more episodes daytime; 6 episodes at night, treat by eating only banana, applesauce, dry cracker, mashed sweet potato. Abdominal pain at times. Difficulty sleeping at night. 4/5/21: mostly watery stool, weakness. Eating beef broth, Pedialyte for liquid replenishment, dry toast, banana, applesauce. Better sleep at night. Improved diarrhea. 4/6/21: Only 2 diarrhea epsisodes until night time when 3 episodes and periodic abdominal pain. Ate small amounts of meat, sauerkraut and two eggs on dry cracker that may have brought diarrhea back. 4/7/2021: Slight but explosive diarrhea one time in AM. Returning strength in legs and walking though still weak. Pain and burning in thumb never experienced previously. Only moderate pain and only if I rub the thumb.

Other Medications: Adderal
Current Illness: None
Preexisting Conditions: N/A
Allergies: Gluten
Diagnostic Lab Data: None
CDC Split Type:
Write-up: Injection site seems higher than normal, almost at the shoulder unlike the first dose. I had soreness within a few hours and by bedtime (7-8pm) my arm was throbbing in pain and shooting numbness into my forearm. The pain woke me through the night while I also began sweating and vomiting with nausea. I can?t lift my arm very high, more painful than the traditional soreness associated with a vaccine, and there?s constant pain even without movement.

Current Illness: Possible exposure to Mycobacterium marinum.
Preexisting Conditions: PTSD, fibromylgia, asthma
Allergies:
Diagnostic Lab Data: You''ll know after Friday. Call my doctor then to find out the details. I''m just reporting it because your VSAFE system requires a smartphone and my phone isn''t smart enough for that.
CDC Split Type:
Write-up: By next day, extreme pain at injection site. The following week, I developed painful Chilblains on my toes. I also have what appear to be granulomas on my fingers, but those could be due to exposure to Myobacterium marinum (or not, I don''t know - I have both an aquarium that I know has that bacteria in it and now these Chilblains, so life is pretty miserable). I have an appointment to see my doctor scheduled but she knows nothing about fish aquarium granuloma so I doubt I''ll get a diagnosis from her. The Chilblains on my toes looks exactly like the photos of the examples I found online of the Chilblains on my toes caused by the COVID vaccine though.

Previous Vaccinations:
Other Medications: Synthroid, Estradiol, Progesterone, Amitriptyline. Tons of multi-vitamins, collagen, extra Vit D, C, etc.
Current Illness: none. Great health other than dealing with chronic cough.
Preexisting Conditions: No thyroid. 3 year chronic cough that was worsened by COVID in February 2020
Allergies: none
Diagnostic Lab Data: I did not enter ER, just waited outside. No medical tests done.
CDC Split Type:
Write-up: 7 hours from vaccine, my heart started palpitating and I started feeling sick. I got in my car to go home from a friends house and started severe chills and called Doctor for fear of heart attack. They told me to go to ER. I continued driving home. Chills got worse. I got in shower with heater on and chills persisted. Drank coconut water and heart palpitations resided. Got in bed and fever spiked to 102 and every bone was inflamed in pain. Nyquil did nothing. After a few hours of severe and unbearable pain I called ER. Headed over to ER at 3:00 a.m. and sat in parking lot. Fever broke at 3:00 a.m. which was hour 14 after vaccine. Other than severe nausea, pain calmed down. Drove home with Tylenol. Took 1,000 mg and finally rested at 4:00 a.m. Woke up at 8:00 a.m. with nausea but pain gone. 24 hours from vaccine, most of the reaction gone. 48 hours out body normal but pain in injection site.

Previous Vaccinations:
Other Medications: BENZONATATE; AZITHROMYCIN
Current Illness: Blood pressure high; Liver disorder (Stated about 7 to 8 years ago); Pre-diabetic
Preexisting Conditions: Medical History/Concurrent Conditions: Asthma; Breathing difficult; COVID-19 (she had COVID three weeks ago); Edema (Verbatim: Edema); Obesity; Pneumonia; Respiratory disorder; Swelling of legs; Varicose veins
Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021330190
Write-up: pain; flu-like symptoms/felt like she had a little bit of the flu; she has one area with a "big circle around it and it"s hard; she had a little bit of pneumonia; got a fever; felt like she couldn"t go to the bathroom, cramps; had trouble breathing; the site was red; swelling/her arm is swelling; it does hurt her, right in that area where the shot was given; arm was sore and achy/her arm started aching; Diarrhea; This is a spontaneous report from a contactable consumer (patient) via medical information team. A 63-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number EN6208, expiration date unknown), via an unspecified route of administration, administered in left arm on 22Mar2021

at the age of 63 years old at a single dose for COVID-19 immunisation. Medical history included ongoing pre diabetic, ongoing high blood pressure, ongoing non-alcoholic liver disease, edema, to help her breathe, pneumonia, COVID in 2021, respiratory problems, asthma, little bit of obesity, swelling in her legs, varicose veins. Concomitant medications included benzonatate at 100 mg to help her breathe, azithromycin (six pills of that, 200mg, two one day and one pill a day until gone) for pneumonia. Patient had her second dose scheduled on 12Apr2021. She explained after the shot, her "arm was sore and achy" she said she also had "pain". She added she experienced "flu-like symptoms". She specified these adverse reactions are all gone now but her arm is still "a little sore" and she has one area with a "big circle around it and it''s hard". She said it could be "swelling". She asked if her reaction was reported as side effects to the vaccine. She expressed being in a rush and is expecting her daughter soon and asked us to be quick. She said she will also consult with her HCP this afternoon. Patient stated she had the first shot on Monday 22Mar2021 and today and last night the site was red, but today in that area she has gotten a big circle around it and its hard. Patient stated she''s had it before with shots and just wanted to make, sometimes she has had to be put on medicine for it, wanted to be sure its healing because it does hurt her, right in that area where the shot was given. She also stated that after she has her second shot on 12Apr2021, she would like to talk to somebody and she would like to be able to have people in her home. She was reporting she had COVID three weeks ago, would she be ok after the 2nd shot to go out? She stated her daughter thinks she needs to wait until the end of April. She verified she did receive the Pfizer BioNtech Covid 19 vaccine. Swelling: Patient stated her arm is swelling. Also stated she always gets that and today there''s a circle there and it is red and hard. Also stated occurred after the shot. Patient reported that the shot hurt like heck and she couldn''t really tell, she has big arms, she knows it was swollen. Reported she took over the counter medicines, last night she noticed it was a circle and it was hard there. Stated area is not swelling anymore, now just one hard red circle. Red and a hard circle: She also reporting her entire arm ached after the shot, she stated she knows her entire muscle was aching. Stated it was swollen quite a bit but now its just red and a hard circle, and it''s ongoing. Arm swelling outcome: Patient reporting yesterday afternoon, she was feeling better, except that one spot. She stated it does hurt when she bends it because she had that one little area that''s swollen. Also stated the swelling started later that afternoon after the shot. Reported she went for a walk with her daughter and her arm started aching. It felt like she couldn''t go to the bathroom, cramps. It felt like she had a little bit of the flu, and it was from the shot but it only lasted a few days. Stated that part went fast, got a fever, other than that, just the one area on her arm. Stated she doesn''t even feel sick from the shot or anything. Stated she had Diarrhea: Stated she had diarrhea in the beginning after the shot then had trouble going to the bathroom. Stated she thinks its because she has IBS and that''s how her body is. She doesn''t know if that''s from the shot or not because that''s how her body always is. Pfizer BioNtech Covid 19 Vaccine: Patient stated she doesn''t want COVID again. She has respiratory problems anyway, she has asthma and a little bit of obesity. She states she was in fear of herself. She doesn''t do well with hospitals and being put under with that medicine. Also stated patient knew COVID causes a lot of people having trouble breathing and she doesn''t want to end up on a breathing tube where its breathing for her and she never sees her family again. Caller states it kind of scared her. Patient stated her niece and nephew, whos got it worse. She stated she went to the hospital and haven''t been back. She stated she was hospitalized about 2 weeks ago, and that''s when she was diagnosed with COVID, before she got the first COVID shot. About the medical history, non-alcoholic liver disease: Stated diagnosed about eight years ago, she would say the same time, about 7 to 8 years ago because she had a virus and when she went in the hospital, the virus had attacked her right kidney and liver. She stated with non-alcoholic liver disease, she is overweight, and that causes her to have issues with her liver. The last few times her liver has been okay. Pre-Diabetic: They have been watching that for a while. Stated she gets edema, swelling in her legs, well, all the time. She has had this the last two

years because she is pre-diabetic and a lot of overweight people have that. She also has varicose veins so that doesn''t help. Stated that was given those to help break up, because she had pneumonia when she got the COVID and she had a little bit of pneumonia and had trouble breathing. The patient was recovering from arm was sore and achy/her arm started aching, swelling/her arm is swelling and for other events it was recovering.

Write-up: Received vaccine at approximately 1040. Patient then went to the self monitoring area where approximately 5 minutes later stated she felt "slight puffiness in lower lip and tingling on tongue". Patent was removed from the self monitoring area and brought to our First Aid room. Vitals remained stable BP 138/70 HR 80 and respiratory rate 16. After 5 minutes within the First Aid area patient stated " the tingling and puffiness of lower lip is extending to the back of my tongue and throat". EMS was called and patient was transported to SVMC ED.

Write-up: It started with extreme fatigue and an extreme headache. The headache caused patient to have an extreme light tolerance causing them to wear sunglasses indoors with the shades drawn three hours after injection. As time progressed the patient began to become nauseous and contract a bone shaking chill. By 5 P.M. the patient was dry heaving and having trouble consuming liquid and solids then around 8:30 the patient vomited for 10 minutes. After that the next day the patients headache continued and they were extreme weak and fatigued.

Write-up: About 3 hours after vaccination, intense headache began. My head felt like it was being pounded with a hammer, and the pain was so intense it traveled down from my forehead to my jaw bone. At around 3:00 pm on April 8, I began to develop a fever which first started at 100 degrees Fahrenheit. By around 5:00 pm, the fever had progressed to 102 degrees Fahrenheit, and the 700mg of Tylenol I had taken was not breaking the fever. I started to get body chills, muscle pain, joint soreness, and cold sweats. Again, Tylenol was not helping. I had no appetite and was having trouble keeping fluids down. Around 11:00 pm on April 8, I took more Tylenol and the fever began to break but did not fully break until 36 hours after the vaccination. It is now April 10 and I am starting to feel like myself again, but for a full 36 hours the pain was so intense that even a light sheet covering my body was painful.

CDC Split Type:
Write-up: After almost two weeks I started feeling feverish and achy all over my body. I had head pain almost to the point of migraine, felt weak and lost my appetite. Every time I stood up I felt sharp pain on the top of my head and got lightheaded. These symptoms responded a little to medication such as Tylenol and DayQuil but steadily worsened over the course of a few days then suddenly worsened. I woke up yesterday feeling more feverish and weak to the point where my mobility was compromised. My head felt like a balloon and hurt around the base of my skull and the top of my head. I had even more severe light sensitivity and could not tolerate sound. I also couldn?t bend down to pick something up or tie my shoes because of the lightheadedness and pain. The headache and migraine symptoms responded well to Toradol and Excedrin but returned full force after any medicine wore off. I am not getting any better despite rest and treatment.

Write-up: I had shot and sat to be observed at 8:30 am. After about three minutes I felt a wave of adrenaline type feeling wash over me and my heart raced and I felt really out of it/fearful. I sat for a minute hoping it would pass, and it didn''t so I asked for help. EMT gave me pulse check and blood pressure, both were very very high (don''t know what) and irregular so they brought ECG. The ECG was also irregular. I felt disoriented and had waves of heat/blood racing/pulse racing. I was taken by ambulance to Hospital. Within 2.5 hours I was feeling better, not recovered but not as acute. They did another ECG, still irregular and did some blood draws which seemed to satisfy the Dr. that nothing was acute. Once I had returned to a more normal level they released me. Tonight at home I still have a bit of a racy clammy feeling but have felt more stable thus far. It was an awful, scary feeling and it come on in just two or three minutes after shot.

Other Medications: Magnesium B-12 Biotin
Current Illness: none
Preexisting Conditions: none
Allergies: codeine
Diagnostic Lab Data: none I did not go to my doctor
CDC Split Type:
Write-up: The shot itself was extremely painful. It felt like I was injected with shards of broken glass and I said this to my husband immediately. I have never had a shot that painful. My first shot in the series was not painful at all and I had no reaction. I soon developed an extremely painful arm and I developed the covid rash. My arm was very swollen and extremely hot. I was very sick until Thursday when I woke feeling better although my arm was still a mess. The rash and swelling lasted about 6 days although the arm was still sore. The side effects I experienced I guess were normal but not the feeling of the shot. The main unexpected feeling was how painful and harsh the shot itself was. It truly was like nothing I have ever felt before.

Diagnostic Lab Data: None
CDC Split Type:
Write-up: Had a sore arm within hour of shot (got it at 7:30pm). Felt a little yucky before going to bed. I made sure to hydrate significantly before the shot and after. I woke up at 3am with chills and had them for about an hour. Woke up the next morning at 9am with with medium neck and head pain and feeling a little chilly and out of it. Mild ache in joints and body overall. At 10am I took one ibuprofen, but at 11am (200mg), kept pushing fluids. 11am headache got worse temp 98.7 (slightly high for me, I am usually about 97). Started having some gastrointestinal issues around noon. Felt nausea and sweaty palms loss of appetite. Had a bowel movement (normal in appearance). That all seemed to pass and I felt better, still tired, for most of the afternoon. Arm was sore to the touch and when moving. I managed to eat a few small meals, kept up hydration, and took a nap late in the day. I woke up at 5pm with headache and body aches all over. No appetite again. Had very little to eat, kept hydrating, At 7pm my vision got a little blurry and I had a minor vasovagal episode. Center of vision blurred, got chills and sweaty, nausea, and I had to poop (it was less formed). I rested, cool compress, and raised my feet. It all passed in about 20 minutes. I had major loss of appetite rest of the night (couldn''t eat anything), kept hydrating, and went to bed. Slept through the night with no incidents. Woke up at 9am second day and had a small breakfast, though my appetite is still not back. Generally feeling exhausted, but no headache or aches in the body anymore. My arm is still sore. Had some more GI distress (another less formed poop around 11am). My appetite returned by early afternoon on the 2nd day post-vaccine. Still tired and generally feeling "off," especially mentally. Had brain fog all afternoon and my ears felt plugged today. Hard to concentrate on a task.

Allergies:
Diagnostic Lab Data:
CDC Split Type: US0095075132104USA002099
Write-up: The consumer also reported the side effects as being "uncomfortable"; The consumer reported being itchy, on the arm, as well as experiencing swelling and redness; The consumer reported being itchy, on the arm, as well as experiencing swelling and redness; The consumer reported being itchy, on the arm, as well as experiencing swelling and redness; The consumer reported receiving the second dose, of the PNEUMOV AX 23 vaccine, in 2014, and the first dose in 2011.; This spontaneous report was received from a currently 64 years old female patient, referring to herself. The patient''s concurrent condition included multiple sclerosis. The patient''s concomitant therapy included bupropion hydrochloride (WELLBUTRIN). The patient was allergic to ampicillin, cephalexin (KEFLEX) and sulfacetamide sodium (+) sulfadiazine (+) sulfamethazine (SULFA). On an unknown date in 2011, the patient was received the first dose of pneumococcal vaccine, polyvalent (23-valent) (PNEUMOVAX23) (strength, dose, lot# and expiration date were not reported; route was reported as injection) as a prophylactic. On an unknown date in 2014, the patient was received the second dose of pneumococcal vaccine, polyvalent (23-valent) (PNEUMOVAX23) (strength, dose, lot# and expiration date were not reported; route was reported as injection) as a prophylactic (inappropriate schedule of product administration). On unknown

dates in 2014 (reported as after the 2nd dose), the patient experienced side effects: being itchy, on the arm, as well as experiencing swelling and redness, which had been confirmed by the patient that occurred on the upper arm at the injection site. It was reported that the side effects as being "uncomfortable". No special treatment was given for the events. The outcome of the events was reported as recovered on unknown dates in 2014. The causality assessment between above mentioned events and pneumococcal vaccine, polyvalent (23-valent) (PNEUMOVAX23) was not reported.

Write-up: Patient started to feel dizzy, shaky and said she was having some trouble breathing about 15 minutes after receiving the vaccine. She had been drinking water but did not have anything to eat that morning. Upon talking to patient she did not seem to be out of breath and could talk normally. We had her sit and try drinking some orange juice but it did not seem to improve her symptoms. She eventually asked to take a walk and get a small snack. A pharmacy technician went with her and after sitting back down and eating something she was started to feel better. About 10 minutes after eating the patient was feeling fine. This was about 1 hr and 30mintues after receiving the vaccine.

Previous Vaccinations:
Other Medications: one aspirin daily; generic Zyrtec; multivitamin; generic Nasonex spray (only used during allergy season--did use during this time). Occasionally take generic Tylenol for any muscle aches/discomfort.
Current Illness: No illnesses for a very long time.
Preexisting Conditions: Past history of breast cancer in 2014 but now clear and clean. Both hips replaced in 2016.
Allergies: Allergic to sulfa drugs, penicillin, bee stings. No food allergies.
Diagnostic Lab Data: None...did not seek medical help.
CDC Split Type:
Write-up: Headache, dizziness, extreme muscle ache in places like arms and legs and buttocks, nauseous. Went to bed early with 3 extra strength generic Tylenol and woke up okay except for a sore arm (that wasn''t a big deal).

Other Medications: Same as just reported....I thought I could report the effects of both doses on the same form....
Current Illness: None.
Preexisting Conditions: Same as just reported but note that both hips were replaced in 2016.
Allergies: Same as just reported...
Diagnostic Lab Data: None
CDC Split Type:
Write-up: I ran a few errands after the vaccinaction and got home about 3:30pm. All of a sudden I began to feel hot and dizzy. Then the muscle aches started so I went to bed. But this time it didn''t go away! Today is now 4/14/2021 and I am still having muscle ache in my right upper thigh and right side buttocks. It is lessening but it also keeps me from getting a good night''s sleep. I''ve never had such a sensation. Even after my hip replacement surgeries I didn''t have this kind of discomfort. I sure hope it ends pretty soon. For the past 2-3 years I have a routine of walking a minimum of 2 miles daily and that''s during the winter as well since I''m up here in my state. I''m strong and I''ll get over this but I never expected this. It feels like a "virus" has settled into the muscle tissue surrounding my right side hip implant. I keep walking and doing my other exercises but it''s very tiring. Just wanted someone to know about this. And, no, I did not bother going to the doc''s with this. Why would I? The "brainwashing" of the past 30 years about not bothering to go to the doc''s if you have a cold because it''s a virus and there''s nothing we can give you for a virus has really worked. I stay away from the doc''s as much as possible!

CDC Split Type:

Write-up: I had chills Friday night (about 12 hours later); no fever. I woke up on 3/27/2021 with a fever of 101.4, headache, nausea, aches and sinus area pain. At 8:30am, I took one Advil tablet; took another one at 12:30am and the fever broke. By about 5-6 almost everything had resolved itself - fever was gone, achiness, face pain was gone. Still had a mild headache. By Sunday morning, 3/28 I was totally fine.

Previous Vaccinations: shingles vaccine 2 yrs ago--swelling, hardness and redness 1 wk.
Other Medications: atorvastatin 10 mg, lexapro 20 mg., centrum silver for women, metformin 500 mg. x 2
Current Illness: none
Preexisting Conditions: diabetes type II, osteoarthritis
Allergies: erethromycin, depakote, skelaxin, celebrax
Diagnostic Lab Data:
CDC Split Type:
Write-up: The first one on 3/16/21 only causes soreness for about 2 days. The second one started swelling into a very hard bump and redness and has remained that way. Also, about 30 hrs. after I received it, I walked to the store (across the street and up 2 buildings) and found myself staggering and struggling to walk straight. I am feeling better today, but not well enough to resume normal activities. I felt "loopy" yesterday, required a couple of 3 hr. naps yesterday and today.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient was given vaccination and asked to sit in observation area for a minimum of 15 minutes. Within the first 5 minutes, the pharmacist was alerted to the patient dropping his phone and glasses to the floor and staring off into space. The pharmacist proceeded to make contact with patient by calling their name and giving them gentle taps on the shoulder and knee. The patient "came to" within a few minutes stating that they could hear and see but felt as though they were "off in space" . Once the patient "came to" they were coherent but perspiring a bit. The patient was offered water and a cool damp cloth. The patient was offered EMT services which they declined. The patient was made to wait another 15 minutes in the observation area. The patient did have a spouse with them who would be driving them home. The patient was called later in the day to by the pharmacist to see how the were feeling. The patient stated they were fine and appreciated the follow-up call.

Current Illness: Foot surgery 3 weeks before
Preexisting Conditions:

Allergies:
Diagnostic Lab Data: Blood Work Trypsin level compliment levels
CDC Split Type: vsafe
Write-up: About thirty hours after getting the vaccine I had some itching in my hand followed by a swollen lip the next day. Four days after the shot I had a shrimp dinner, and my tongue was swelling. I have never had any food allergies. I went to the ER where they gave me two doses of Epinephrine and I was admitted to the ICU with epinephrine drip. I was discharged the next day with a prescription of prednisone. I had been given 40mg of Solumedrol I tried not to take the prednisone as advised by the doctor. I started to get hives the following day. I was later prescribed multiple antihistamines and stayed on all of those since then. I am taking Zyrtec Twice daily Singulair once daily and Ranitidine since then and I have not had a reoccurrence of the hives. The doctor advised getting the Johnson & Johnson instead of the second Moderna. I was unable to get a Johnson & Johnson so now I am waiting again.

Current Illness:
Preexisting Conditions: Anxiety, Depression, PTSD, Degenerative Disc Disease
Allergies: Fresh pineapple, Zpack
Diagnostic Lab Data:
CDC Split Type:
Write-up: The next day, I had a headache, 102 degree temp, vomiting, nausea, chills, body aches, dizziness , dehydration and diarrhea. I had no appetite from this time and for days after. I hydrated with water, and took Tylenol, but it had no real effect. Day 5 I drank Pedialyte mixed with water and was able to eat soup and keep it down. The fever above 100 degrees lasted through Day 4, then was low grade (99.9) through Day 8. Day 8 I still had a headache, low grade temp and shakiness/dizziness. Brain fog is all I can use to describe the inability to focus my thoughts during even the most mundane conversations. My left arm felt like it had been punched for 3 days after the vaccine was given.

Other Medications:
Current Illness:
Preexisting Conditions: Medical History/Concurrent Conditions: Ischemic colitis (in past she had ischemic colitis and thinks that maybe the cramping started triggering it again)
Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021381876
Write-up: the contractions and cramping sensation went trough out her entire chest region and her back (like heart attack symptoms); the contractions and cramping sensation went trough out her entire chest region and her back (like heart attack symptoms; in the left arm it was cold and tingling; in the left arm it was cold and tingling; experiencing contractions and cramping in her arm and the left side of her torso in the ribcage area that continued for 24 hours; diarrhea on the weekend; strong cramps in her stomach (stomach flu-like symptoms); This is a spontaneous report from a contactable consumer or other non hcp (patient). A 53-years-old female patient received bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE, Formulation: Solution for injection) dose 1 via an unspecified route of administration in Arm Left on 23Mar2021 (Lot number and Expiry date was not reported) as single dose for covid-19 immunisation. Medical history included ischemic colitis in the past and she thinks that maybe the cramping started triggering it again. The patient''s concomitant medications were not reported. On 02Apr2021 strong cramps in her stomach (stomach flu-like symptoms) and on an unspecified date, the patient experienced the contractions and cramping sensation went trough out her entire chest region and her back (like heart attack symptoms), in the left arm it was cold and tingling (vaccination site coldness), (paraesthesia), experiencing contractions and cramping in her arm and the left side of her torso in the ribcage area that continued for 24 hours (muscle spasms) and diarrhoea on the weekend. Her second dose is scheduled on 13Apr2021, she would like to know if there are recommendations for her second dose because she heard that with the second dose the side effects are worse, she would like to know if someone else has reported these symptoms. She would like to know if she should possibly receive the vaccine in her thigh instead of her arm and if that would be helpful. The outcome of the events diarrhoea was recovered on 05Apr2020 and

outcome of contractions and cramping sensation went trough out her entire chest region and her back (like heart attack symptoms) was not recovered and rest of the events was unknown. Information on the Lot/Batch number has been requested

Current Illness: First Moderna Shot on 1/21/21
Preexisting Conditions: Arthritis and Anxiety
Allergies: Apricots, Neosporin, and Prednisone
Diagnostic Lab Data: I recently had a full spectrum blood panel done. All levels were normal.

Had testing done for RA and Lyme and they were negative. Also had physical neuro test and no concerns. PCP has stated on multiple occasions that everything is normal.
CDC Split Type:
Write-up: I?ve been vaccinated for 2 months now. My new symptoms just started to really ramp up 3 weeks ago. Of course I had the initial symptoms of being sick for 2 and 1/2 days after my second shot?.but recently it started with leg aches and then it matriculated up into my upper body. My legs have since become less achy per say. Now it?s my upper body and mostly in my shoulders (more in the one I received the shots in), back pain, and general fatigue. Currently still dealing with the upper body ache discomfort, cold hands and feet but I noticed that I have a slight headache always and my vision has became a little blurry in one eye. The headache severity is day to day but what?s interesting now is I?m having ear ringing and sensitivity to sound. Headache seems to emulate from the back of my skull and the crown of my head. The other lingering piece is the fatigue after doing activities. I?m an active guy and recently my body gets really achy after I do anything super strenuous and I get tired. Also feeling a little shaky, some rapid heart rate, and some circulation issues in my legs and arms. Note; never experienced these issues before the Vaccine aside from the normal wear and tear of an active lifestyle.

CDC Split Type:
Write-up: 5 days after the 2nd dose of moderna vaccine my husband started shaking severely, his

whole body, stating he was freezing and he had trouble walking, he wobbled to his recliner. I covered him with several heavy blankets and he continued to shake in episodes of 10 - 15 seconds, then it would stop for 10 -15 seconds and start again. I tested his blood sugar which was 80. He did not have a temperature. This shaking continued for about 1 hour before slowly subsiding and gradually fading away. He then slept for 2 hours. He awoke the next morning with a moderate headache and a temp of 99.5 and felt achy all over. I gave him 2 extra strength tylenol and left for work. At 10:30 am his temp was still the same he took more tylenol. I called his physician, a nd reported his symptoms to the nurse. The doctor felt it was a reaction to the vaccine and recommended rest, fluids and tylenol.

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: teeny weeny buzzing sound in right ear , different sound in ear; woke up during a night, and could not hear/could not hear for a week; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of SUDDEN HEARING LOSS (woke up during a night, and could not hear/could not hear for a week) in a 72-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 19B21A and 30A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient''s past medical history included No adverse event (Medical history not provided). On 05-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 04-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 10-Mar-2021, the patient experienced TINNITUS (teeny weeny buzzing sound in right ear , different sound in ear). In March 2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced SUDDEN HEARING LOSS (woke up during a night, and could not hear/could not hear for a week) (seriousness criterion medically significant). In March 2021, SUDDEN HEARING LOSS (woke up during a night, and could not hear/could not hear for a week) had resolved. At the time of the report, TINNITUS (teeny weeny buzzing sound in right ear , different sound in ear) outcome was unknown. Concomitant product use was not provided.

Treatment included a visit to the patient"s Primary Care Physician (PCP) who checked her ear and said her ear looks good, there was no wax. An appointment was scheduled for an Ear Specialist Doctor. The patient stated there are still different sounds in her right ear. Over a period of time it is getting better but still not there.; Sender"s Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Further information has been requested.

Preexisting Conditions:
Allergies: No allergies to a vaccine component.
Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient reported a history of anxiety related to vaccine injections and a history of fainting post vaccination. Patient was brought to a private room for the vaccination and did faint about 5 minutes post vaccination. Patient was brought to the ground. Patient was able to respond to questions and only lost full consciousness for about 10 seconds. Patient recovered from the event after about 15 minutes and waited at our clinic 30-40 minutes post vaccination. By the time the patient left, he had fully recovered.

Obesity, Class III, BMI 40-49.9 (morbid obesity) ? OSA (obstructive sleep apnea) ? Hypertension ? Anxiety
Allergies: None known
Diagnostic Lab Data: Labs were notable for a WBC 13.22 and Cr 0.76. TTE showed hyperdynamic LV function with EF $g65% and no tricuspid regurgitation with no concern for right heart strain. A follow-up d-dimer was ordered and returned at 1661 resulting in the recommendation to present to the ED
CDC Split Type:
Write-up: Patient was recently hospitalized for pulmonary embolism with acute cor pulmonale. First noticed increased shortness of breath on 4/4/21 when shoveling mulch and describes feeling "more winded than usual" with physical activity. He presented to the outpatient primary care clinic on 4/6/21 for evaluation and serum labs and TTE were ordered. Labs were notable for a WBC 13.22 and Cr 0.76. TTE showed hyperdynamic LV function with EF $g65% and no tricuspid regurgitation with no concern for right heart strain. A follow-up d-dimer was ordered and returned at 1661 resulting in the recommendation to present to the ED. Upon presentation to the ED, he was hemodynamically stable with an SpO2 of 97% on room air. CT Chest PE protocol was ordered and showed multiple bilateral lobar, segmental, and subsegmental PE with findings suggestive of right heart enlargement was well as areas of pulmonary hemorrhage and developing infarcts. He was given a heparin bolus and he was admitted to the Adult Hospitalist Service. The following morning, patient''s hemoglobin remained stable and he continued to feel clinically well. He was transitioned from the heparin infusion to subcutaneous enoxaparin. He was discharged on 4/9/21 with a plan for self-injection of enoxaparin and close follow-up with his PCP.

CDC Split Type:
Write-up: Achy legs starting with tight prickly feeling behind knees and thighs and progressing to achiness in entire leg from below buttocks and into feet. Finally contacted doctor on day 8 after feeling symptoms and heard back from him on day 11 (today). Use of 2-3 tablets of Advil twice a day with food for 3 - 4 days was recommended. This will only be started later this evening since I had tried taking Motrin this morning which did not seem to help.

Write-up: On the 8th, I woke up with what I thought was a bug bite on my middle left side of my back. It grew - a rash - over the weekend. April 12, I saw a physician and was diagnosed with Shingles. Treatment: Anti-Viral to take for seven days - Acyclovir. I took that for 7 days and by April 16th the rash was dried/scabbed over and my symptoms were tiredness and pain. I did take a couple days off work. I had a follow up appt on April 16th and she said it looked like everything was healing and I was starting to feel better. Pregnancy history - I have had two miscarriages in the past year - August 2020 and February 2021. I just took a positive pregnancy test on April 9th, 2021. Estimated date of delivery - December 15, 2021.

Current Illness: none
Preexisting Conditions: none
Allergies: lactose intolerant
Diagnostic Lab Data:
CDC Split Type:
Write-up: Rash and/or hives began in a small area initially on right wrist moving over to include underside of wrist and arm to inside elbow area. Over approximately the next week several other areas developed hives - left arm- wrist to inside elbow , chest, neck, jaw, slight area on face and a 2" round spot on top of right foot. Extremely itchy! Started using Benadryl Gel and Benadryl tablets for itching, didn''t really seem to help much. Dr prescribed a topical cream with a steroid in it to reduce itching. No noticeable change. Also switched from Benadryl to Zyrtec tabs. Nothing seems to improve itching - can''t sleep. Rash is currently dissipating slowly - no new areas for 1 week.

Previous Vaccinations: previous vasovagal reactions
Other Medications:
Current Illness:
Preexisting Conditions:
Allergies:
Diagnostic Lab Data: blood pressure was 128/82 and pulse was 84.
CDC Split Type:
Write-up: Patient experienced a vasovagal reaction after vaccination. The patient reported feeling hot, sweaty, dizzy, and nauseous about 5 minutes after vaccination. The patient was brought to the floor and provided with water and ice packs to use as cold compresses. The patient never fully lost consciousness and recovered from the event fully after about 10 minutes. He was able to leave the clinic after observation and there was no need for emergency medical services. Afterward, the patient reported a history of vasovagal reactions post vaccination.

Current Illness: None Had annual physical onApril 2nd, no issues, didn''t require bloodwork
Preexisting Conditions: None
Allergies: Wheat Seasonal allergies Some animals, cats especially.
Diagnostic Lab Data: None
CDC Split Type:
Write-up: I had the vaccine n Sunday, Tuesday morning I woke up with a very tight feeling across my chest/ rib cage area, particularly on my right side, underarm, under breast area. I also had some weakness in my left arm where the shot was given. The tightness in my chest was not affecting my ability to breath, I was able to go on my usual daily hour-long walk but it was concerning me enough for a call with a Dr. I had spent the day before (Monday) using a wood pellet BBQ so I though maybe the issue was related to smoke. The Dr prescribed a salbutamol inhaler which I have used before for seasonal allergies but that didn''t really d anything to help with the tight feeling. The feeling of tightness remained all week (and still does to some extent 11 days later). On the Friday I noticed a small dark spot, approx 2mm, a bit like a blood blister on the back of my right thigh. I have had these before fairly infrequently, and I see a dermatologist once a year for a check up and they are not concerned, and they usually go away on their own. But, the combination of a new blood spot and the continued tight feeling across my chest had me concerned enough to call my regular Dr''s office. I was also feeling occasional sporadic aches in my legs in varying places. I spoke to a practice nurse who was very reassuring that she had spoken to many other patients that had also been experiencing chest tightness that had gone on for days after the Janssen vaccine, so after that I felt less concerned about the symptoms. I am still experiencing the tightness in my chest which has affected my shoulders and neck with what feels like muscle tension, and also been accompanied by some mild headaches at the sides of my head. I was pretty anxious about getting the vaccine which is not something I usually struggle with and on the Tuesday after the vaccine I felt particularly irrational and also very tired.

Other Medications: Hydroxycholoroquin Protonix Zycam Flonase
Current Illness: None
Preexisting Conditions: Palandromic Rheumatism
Allergies: None
Diagnostic Lab Data: none
CDC Split Type:
Write-up: I was diagnosed with "Palandromic Rheumatism" in the fall of 2019 and started on Hydroxycloroquine in November 2019. I had little join pain in the 15 months following the start of that medication. I had dose one of the Pfizer vaccine on February 16, 2021 and did not have any immediate reaction. However, my joint inflammation (related to "Palandromic Rheumatism") flared up within a week or so of the first dose. I called my rheumatiologist and asked whether it could be related to the vaccine and received a "possibly". I proceeded to get the second dose. The joint pain has been significant and has persisted. On March 31, I was prescribed prednisone. Although there was some immediate relief, the pain has continued to come and go in my wrists. My prescription will end in a few days and we shall see what happens. My situation is tolerable and I am glad to be vaccinated. However, my concern is that autoimmune disorders are agragavated by the vaccine. I have a friend who has a similar situation tho much more seriously. He had not considered that it might be related to the vaccine. I just want to make sure the CDC is aware of these kinds of possible impacts, has the available data from those who have received the vaccine, and can inform the public and the professional community and hopefully have some suggestions on preventive measures to avoid these kinds of reactions.

Write-up: See continuation page Additional information for Item 18: 4/01 14:15 received vaccine in left arm. Injection site sore. 4/02 08:00 physical activity felt fine 4/02 23:00 unable to clear acid reflux 4/03 00:00 feeling off a little 4/03 02:00-04:00 extreme cold, pile on blankets, sock on feet, heating pad on chest. Uncontrollable shaking starting in the neck then on to the arms and hands, shoulders muscle and joint pain nausea, vomiting - first time blood only, second through fourth dinner came up. intestinal track was emptied multiple times heavy breathing temperature was normal 97.7 (this is my normal) 04/03 04:00-10:00 slept off and on temperature 97.7 04/03 11:00-12:30 slept temperature 100.2 04/03 12:30-14:30 got up and went out of the bedroom and feel asleep on couch 04/03 14:30- 24:00 no loss of smell or taste but no desire to eat skipped normal physical activity too sick and concerned about throwing up blood upper lip cracked and breaks out into what appeared a cold sore, spread to half the upper lip 04/04 08:00 a little cereal for breakfast, no lunch or dinner could only ski for four runs, panting after each a queasy stomach will continue throughout the days 04/04 10:00 extremely tired, muscle and joint pain, lips cracked, upset stomach temperature 100.2 slept the rest of the day 04/05 temperature 98.7 skied a little panting at bottom of each run ate a little breakfast, lunch and dinner (only rice with gravy) upper lip skin peals tired, slept remainder of the day 04/06 temperature 96.7 more cracking of upper lip, skin peels roof of mouth is sore causing difficulty eating gums are very sore to floss ate breakfast, lunch and minimal dinner still panting after each run still extremely tired and sleeping much of the day 04/07 temperature 97.7 ate breakfast, lunch and small dinner continue to pant after each ski run still tired and sleeping most of the day 04/08 temperature 96.7 first time not panting after each ski run upper lip, roof of mouth and gums still sore when bending over got dizzy (this occurred occasionally throughout the days) sleeping much of the day 04/09 temperature 97.3 The upper lip, roof of mouth and gums sores it not a cold sore, I suspect it is an auto immune response. This magnification was occurred too quickly for a cold sore and cold sores don''t peel day after day Still day time sleeping 04/10 temperature 97.7 Still tired took a few ski runs, still panting after each tried an easy kayak run, only got 2.3 miles before nodding off while paddling, stopped at an island and slept. 04/11-18 daily routine is ski for 1 or 1.5 hours, go home and sleep for several hours a queasy stomach persists off and on, especially with physical exertion any other physical activity is exhausting somewhere in this time frame, stopped panting at the bottom of each ski run 04/19-23 temperature is now in the range of 96.2 - 96.4 still tired with daytime sleeping You have lost me. I will not follow guidelines that are against my best judgment for right or wrong. I knew better then to get the second vaccine so quickly. There was no research that indicated this was the optimum time frame. The only justification was what was done during the trials, which was to rush it to market and garner the highest efficacy numbers. As seen here, the outcome was anything but mild side effects and they continue.

Write-up: Fever; Chills; Headache; she blew a blood vessel in her right eye; This spontaneous case was reported by a consumer and describes the occurrence of CONJUNCTIVAL HAEMORRHAGE (she blew a blood vessel in her right eye) in a 63-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 037B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient''s past medical history included No adverse event (No medical history reported.). On 09-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 09-Apr-2021, the patient experienced CONJUNCTIVAL HAEMORRHAGE (she blew a blood vessel in her right eye) (seriousness criterion medically significant). On 12-Apr-2021, the patient experienced PYREXIA (Fever), CHILLS (Chills) and HEADACHE (Headache). At the time of the report, CONJUNCTIVAL HAEMORRHAGE (she blew a blood vessel in her right eye) and HEADACHE (Headache) outcome was unknown and PYREXIA (Fever) and CHILLS (Chills) had not resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was unknown. No treatment details were reported. This case concerns a 63-year-old female with a serious unexpected event of conjunctival hemorrhage, and nonserious expected pyrexia, chills, and headache. Event onset the same day as after first dose mRNA-1273. Event outcomes unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender''s Comments: This case concerns a 63-year-old female with a serious unexpected event of conjunctival hemorrhage, and nonserious expected pyrexia, chills, and headache. Event onset the same day as after first dose mRNA-1273. Event outcomes unknown. Based on current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: Stomach pain; Aslight headache before the first dose/headache was still bad; Threw up a significant amount approximately 4 ounce cup of bright red blood; Still not feeling well; Just sleeping; Not active; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of HAEMATEMESIS (Threw up a significant amount approximately 4 ounce cup of bright red blood) in a 41-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 019B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient''s past medical history included No adverse event (No medical history was reported). On 02-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 02-Apr-2021, the patient experienced HAEMATEMESIS (Threw up a significant amount approximately 4 ounce cup of bright red blood) (seriousness criterion medically significant), MALAISE (Still not feeling well), SOMNOLENCE (Just sleeping), SLUGGISHNESS (Not active) and HEADACHE (Aslight headache before the first dose/headache was still bad). On 20-Apr-2021, the patient experienced ABDOMINAL PAIN UPPER (Stomach pain). On 04-Apr-2021, SOMNOLENCE (Just sleeping) and SLUGGISHNESS (Not active) had resolved. On 21-Apr-2021, ABDOMINAL PAIN UPPER (Stomach pain) had resolved. At the time of the report, HAEMATEMESIS (Threw up a significant amount approximately 4 ounce cup of bright red blood) and HEADACHE (Aslight headache before the first dose/headache was still bad) outcome was unknown and MALAISE (Still not feeling well) had not resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Treatment information included acetaminophen, aspirin and caffeine, Excedrin and adult Pedialyte. On 02 Apr 2021, the patient woke up and threw up approximately 4 ounces of bright red blood. The patient''s spouse called the emergency room (ER) who informed the spouse that was not uncommon, to have the patient come and recommended the patient drink adult Pedialyte and rest. The patient continued to feel unwell throughout the night. At 9:00 pm that evening, the patient was able to get up and eat. Company Comment: Based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded.; Sender''s Comments: Based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded.

Write-up: Patient received vaccine, was waiting for about 5 minutes in the waiting area when another customer yelled "He"s passing out!". Upon running over, I noticed that the patients eyes rolled in the back of his head, his legs were straight out, and was making "groaning" noises. He was in this state for about 30 seconds. 9-1-1 was called immediately and patient was given water. When asked if he knew where he was, he stated "a pharmacy store for my COVID shot." He told me he remembers everything, saying he felt like he was in a dream during seizure. Questioned if he had ever had seizures before and he stated once when he was giving blood. No shortness of breath or hives noticed, therefore no EpiPen was administer. Ambulance arrived and asked similar questions that we had asked, and patient stated he was "just hot." He also seemed a bit yellow in color. Patient was able to stand up and walk to the ambulance with little to no help. All of this occurred in about 10 minutes total.

Diagnostic Lab Data:
CDC Split Type:
Write-up: The patient received their 1st dose of the COVID-19 vaccine even though they were not yet 16 years old. This error was discovered at the time of checkout when trying to schedule for dose #2. The computer system flagged it and would not schedule the 2nd dose due to the patient being <16 years old. I was then notified of the error. This patient had been an add-on to the clinic and did not already have an appointment for the future so he was added into the system just prior to getting the vaccine. The patient came with his father and completed the Prevaccination Checklist and it was marked as age 16. The RN administering the vaccine had the father complete and sign a parental consent form. On this form, the DOB for his son was listed but the RN did not catch that the patient was 4 days away from turning 16. The RN reviewed the checklist and signed and dated it and proceeded with the vaccination. There were no contraindications marked on the form. The patient waited the 15 minutes following vaccination and did not experience any negative side effects during that time. When I was notified of the error, I spoke to the patient and his father and explained that he should not have received the vaccine due to his age being <16 years old. I also told them I would be following up with the RN that gave the vaccine and that I would be filing a report and I got the father?s phone number and said I would call if there was any other info that I needed. They were instructed to wait until after patient turned 16 years old to call the rescheduling number and then make an appointment for his 2nd dose. I followed up with the RN and with the check-in staff to make sure to screen people carefully to make sure they are at least 16 years old.

Write-up: I could breathe like I have not able to breathe in years; This is a spontaneous report received from Pfizer. A contactable consumer, the patient, reported a patient of unspecified age/gender received the first dose BNT162b2 (solution for injection; batch/lot and expiry information not reported) as a single dose via unspecified route on 15Mar2021, for COVID-19 immunisation. Relevant medical history included ongoing Chronic Obstructive Pulmonary Disease (COPD). There were no concomitant medications reported. The patient reported that he/she received the first dose of the vaccine last Monday (15Mar2021) and Tuesday and Wednesday he/she could breath like they have not been able to in years. The patient reported that he/she has COPD and unfortunately it was only a two-day good breathing event. The patient explained that he/she has asked around and several people that have COPD have said the same thing and for them it was also was short-lived. The outcome of the event breathe like I have not able to breathe in years was recovered on 18Mar2021. No follow-up attempts possible; No further information expected and information about batch /lot number(s) cannot be obtained.

Write-up: left arm pain at the injection site; could not move her arm at all; it has spread up to her shoulder.; This is spontaneous report received from a contactable consumer (patient) reported for herself that a 64-years-old female patient received BNT162B2, dose 2, via an unspecified route of

administration, administered in left arm on 02Apr2021 10:45 AM (Lot Number: ER8734) as single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient previously received first dose of BNT162B2 (Lot # EN6207) in the left arm on 14Mar2021, before noon, for COVID-19 immunisation. Caller had a hard time reading this Lot number on the card that was provided to her. She stated the first Lot number was covered up a little by the second Lot number. She verified that this was the Lot number. She gets magnifying glass to read card. The patient received the second dose of the Pfizer-BioNtech Covid-19 vaccine on Friday, she had left arm pain at the injection site and it had spread up to her shoulder. She had her second shot this past Friday and her left arm hurt so bad where the shot was, she can feel it up to her shoulders. It was not swollen, she just felt it. She asked if she should keep taking Acetaminophen. She stated yesterday and this morning she was fine but then after she moves, it hurts again. She stated she can feel it and it was hard to move at night, she keeps her arm on a pillow. She stated she does have very small arms. Caller did not specify her start date of adverse event onset but that her symptoms were still ongoing and that her treatment medications helped. Treatment included: Caller stated she has used ice packs and has taken Acetaminophen Extra Strength (Lot # SEA041, Expiry Mar2024) and Ibuprofen, (Lot # OCE3209A, Expiry Jan2022), and Acetaminophen PM (Lot # PPA014, Expiry Sep2021) for treatment. Caller stated that the Ibuprofen was every 6 hours, the Acetaminophen Extra Strength was in between 5-6 hours, and the Acetaminophen PM she took a couple of nights ago and last night. Caller stated her treatment medications help. Caller''s arm hurting was ongoing. Caller stated the Acetaminophen PM helped her sleep, not all night but some sleep. She was having a really hard time moving at night, she could not move her arm at all and would keep it on a pillow and then yesterday she felt fine. This morning trying to do a few things she felt good and then once she got going, she said forget it, and had to take two Acetaminophen right now. She had really small arms. She didn''t know how long it should last. The outcome of the event "left arm pain at the injection site" was not recovered, of the event "could not move her arm at all" was recovered. The outcome of the other event was unknown. No follow-up attempts are possible. No further information is expected.

Write-up: Erythema multiforme; asthma attack/shortness of breath/cough; Rash started on legs on the 03Apr2021 late morning buy next day (04Apr2021) full body rash from shoulders to top of feet; extreme exhaustion; This is a spontaneous report from a contactable consumer (patient). A 68-years-old non-pregnant female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot Number: ER 8730), via an unspecified route of administration, administered in left arm on 02Apr2021 09:15 as single dose for covid-19 immunisation. Medical history included heart disease, high blood pressure, asthma, drug hypersensitivity and wasp stings. Concomitant medication(s) included amlodipine; aspirin and atorvastatin. The patient was not pregnant at the time of vaccination. The patient had no other vaccine in four weeks. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 03Apr2021 09:45 late morning, the patient experienced rash started on legs by next day (04Apr2021) full body rash from shoulders to top of feet. Later on 03Apr2021, extreme exhaustion and dry cough that went into shortness of breath and asthma attack. Visit to ER and later sent to dermatologist. Possible Erythema multiforme. As of 09Apr2021 still have rash and exhaustion and dry cough. It was unknown whether patient received any treatment. The outcome of the events was not recovered. No follow-up attempts are possible. No further information is expected.

Diagnostic Lab Data: Test Name: FSH; Result Unstructured Data: Test Result:Unknown results; Comments: previous values; Test Date: 20201219; Test Name: FSH; Result Unstructured Data: Test Result:skyrocketed from previous values; Comments: They obtained an FSH level and it had skyrocketed from previous values not long before my ovaries had shrunk in size by approximately half; Test Date: 20210314; Test Name: nasal swab/Covid test; Test Result: Negative ; Test Date: 20201219; Test Name: ultrasound; Result Unstructured Data: Test Result:ovaries had shrunk in size; Comments: ovaries had shrunk in size by approximately half
CDC Split Type: USPFIZER INC2021392945
Write-up: Diminished ovarian reserve/diminished reserve; fever; chills; hot flashes; nausea; vomiting; migraine headache; vertigo; weakness; They obtained an FSH level and it had skyrocketed from previous values not long before; my ovaries had shrunk in size by approximately half; This is a spontaneous report from a contactable nurse (patient). A 40-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Solution for injection), first dose via intramuscular, administered in right arm on 19Dec2020 09:30 at a single dose (lot number and expiry date were not reported); and then received the second dose on 02Jan2021 09:30 (lot number and expiry date not reported), intramuscularly administered in right arm as a single dose; for COVID-19 immunisation. Medical history included eosinophilic esophagitis and asthma. The patient had no known allergies. The patient was not pregnant at the time of the report and vaccination. The patient had no covid prior vaccination. Concomitant medications which were taken in two weeks prior to vaccination included bupropion hydrochloride (WELLBUTRIN) and ethinylestradiol, norethisterone acetate (LOESTRIN), taken for an unspecified indication, start and stop date were not reported. The patient had no other vaccine in four weeks. On 19Dec2020, the patient experienced diminished ovarian reserve. Patient stated that she was extremely symptomatic after both vaccines and starting on 19Dec2020 had experienced fever, chills, hot flashes, nausea, vomiting, migraine headache, vertigo and weakness. The hot flashes persisted and worsened after each subsequent vaccine, prompting her to go to my MD. They obtained an FSH level on 19Dec2020 and it had skyrocketed from previous values (dates unspecified; unknown results) not long before. An ultrasound on 19Dec2020, showed that her ovaries had shrunk in size by approximately half and she had diminished reserve. Patient was now on supplemental hormones and will be for many years to come as she was only 40. Patient know the vaccine caused this. It was too great of a coincidence. Adverse events

resulted in doctor or other healthcare professional office/clinic visit, disability or permanent damage. As a result of the events reported patient was now on hormonal replacement therapy. The patient was tested for covid post vaccination which included nasal swab/Covid test on 14Mar2021 as negative. The outcome of the events reported was not recovered. Information about lot/batch number has been requested.; Sender"s Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded, for events fever, chills, hot flashes, nausea, vomiting, migraine headache, vertigo and weakness, conversely the suspect drug is considered very unlikely related for other gynecological disturbances. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Committees and Investigators, as appropriate.

Diagnostic Lab Data:
CDC Split Type:
Write-up: When I received the shot I felt it in my teeth. Didn''t think anything of it until that evening when my shoulder started hurting much more than any other shot I''d had before. Sleepless night with so much pain. Pain the next day and next evening so bad that it was impossible to sleep. Finally took a Tylenol and that helped a bit. Better for a few days and then a week after the shot my shoulder is hurting again, with weakness and reduced range of motion. I''m thinking that the needed went in too deep and caused an injury. I have had this issue before where I''ve had a year of pain and therapy to my shoulder and am wondering if it was caused by an incorrect injection during a flu shot.

CDC Split Type:
Write-up: I went to bed around 10:30 and felt completely normal. Around 1AM I woke up with the chills that lasted for about an hour or so. I could not get warm. My body would go from hot to cold and shiver/spasm in a pattern that lasted about a minute or so. this pattern of hot cold and shiver/spasm lasted approximately an hour. when that subsided I started to experience relatively extreme fever and flu symptoms. I completely sweat through my pajamas. My entire body ached and hurt like a normal fever flu but more extreme. Around 2:30AM I took three 500mg acetaminophen, 2 mg Xanax and a 10 mg Valium. I fell back asleep some time between 3:30 and 4:00AM. I woke up at 8:30 with most of the symptoms having dissipated. It''s now 10AM. I still feel groggy and a little achy in my body, but the fever seems to have subsided. For now that is about it

Write-up: Patient received vaccine at 545pm. Administration noted as normal per pharmacist (rph), pt walked to waiting area chair. Approximately 7 minutes later pt asked for water. Pharmacist brought water to pt and asked if he was feeling okay. Pt stated he was having trouble hearing the rph. Rph walked back to pharmacy and continued to observe patient. approx 2 min later, pt passed out from seated position. rph did not see fall. both technician and rph ran out to pt. pt face down and water bottle spilled. assistant store manager reported as well. pt came to immediately and sat up on floor. He attempted to stand to sit in chair, but rph asked him to remain on floor. rph went to get emergency kit while tech observed patient. rph came back with instant ice pack. First pack did not activate but second pack did and had patient hold to his head as there was a visible red spot. Patient continued to be observed and was texting on phone during observation. Patient came up to pharmacist at 6:15 to ask to leave and Rph asked if pharmacy representative to could walk him to his car. Patient denied and Rph asked him to wait additional 5 minutes for observation. After 5 minutes, patient left. Today I called patient. He said he is feeling better and still has mild pain and a headache today.

Write-up: A-Fib; The Pfizer covid vaccine made her heart worse; anxiety; injection site was swollen, red, and warm to the touch; injection site was swollen, red, and warm to the touch; injection site was swollen, red, and warm to the touch/her arm at the injection site was swollen, red, hurting and tender to touch; injection site was swollen, red, and warm to the touch/her arm at the injection site was swollen, red, hurting and tender to touch; heart rate also went up because she is scheduled for chemo, radiation and has an a-flutter/Fast heart beat; heart rate also went up because she is scheduled for chemo, radiation and has an a-flutter; Extreme tiredness; Bad headache; Fever of 99.4, 99.7, and 100.8; Chills; feeling yucky; Body aches; Feeling unwell; sick all day the day after but was fine by Sunday; This is a spontaneous report from a contactable consumer (patient). A 58-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: ER8729), via an unspecified route of administration, administered in arm left on 09Apr2021 at 11:30 (at the age of 58-years-old) as a single dose for COVID-19 immunisation. Medical history included neuropathy on the bottom of her feet, cancer and cannot sleep from an unknown date and unknown if ongoing. Concomitant medication included metoprolol succinate at 275 mg, daily (125mg of metoprolol succinate in the morning and 150mg of metoprolol succinate in the evening) taken for an unspecified indication, start and stop date were not reported. The patient previously received the first dose of BNT162B2 on 19Mar2021 at 10:00AM (at the age of 58-years-old) in left upper arm for COVID-19 immunisation. The patient received her 2nd dose of the Pfizer COVID Vaccine on 09Apr2021. She was sick all day the day after (10Apr2021) but was fine by Sunday. On Monday, 12Apr2021, she mentioned that she underwent radiation therapy, then noticed that her injection site was swollen, red, and warm to the touch on 13Apr2021. On 10Aapr2021, her heart rate also went up because she is scheduled for chemo, radiation and has an a-flutter. She mentioned that the COVID shot made it go up. She is asking how long these side effects should last and for what to do. She mentioned that the nurse at her doctor''s office told her to contact Pfizer on what to do. She is a high-risk cancer patient. She received her second dose of the COVID vaccine on 09Apr2021. The

next day, she experienced tiredness, a headache, chills, and body aches. She also had a fever of 99.4, 99.7, and 100.8. She was feeling unwell. Then she got a fast heartbeat. She has been having that problem. She has A-Fib and A-Flutter. She has been doctoring every week about her A-Fib and A-Flutter. Then she was fine. On Monday, she had radiation. After radiation, on Tuesday, 13Apr2021, her arm at the injection site was swollen, red and hurting. Then her heartbeat started back beating fast. She has had a headache on and off. She had a headache on Monday, Tuesday and Wednesday. She does not look at her weight. She has gained so much weight since cancer. She retains liquids because of her cancer. She is probably about 230 pounds. She has been tired because of her cancer. But this was different, this was extreme tiredness. Began on Saturday, 10Apr2021 whenever she woke up. With her cancer, she cannot sleep. After the second dose of the covid vaccine, she was so tired, she actually rested well. She was feeling yucky, with chills, a headache and a fever. She is grateful that she was able to get some sleep. It was completely resolved on Sunday morning, 11Apr2021 whenever she woke up. Bad headache began on Saturday, 10Apr2021 whenever she woke up. Sleeping relieved her headache. She took some Tylenol even though she is not supposed to take Tylenol because of her chemotherapy. Tylenol could affect her liver because of the chemotherapy. She took the Tylenol for her fever and to help her headache. Her headache is on and off, but it is a lot better since her first headache. Her headache was the worst on the first day. She thought her symptoms were clear until her arm at the injection site was swollen, red and hurting. It was also hot to touch. Chills, body aches and fever of 99.4, 99.7, and 100.8, feeling unwell began on Saturday, 10Apr2021 whenever she woke up. Completely resolved on Sunday morning, 11Apr2021 whenever she woke up. Her heart started racing on Saturday, 10Apr2021. Then it resolved on Sunday, 11Apr2021. Then her fast heartbeat came back whenever her arm at the injection site started to get swollen, red and hurting. She thinks that her fast heartbeat could be anxiety too. She has anxiety. She takes heart medications that are supposed to slow her heart down. The medications are not working. Chemotherapy makes her heart worse. She called her doctor about her heart beating fast. She has not heard back from her doctor yet. Usually her doctor will up her mediations. Now tomorrow, she will be filling her body with poison. Chemotherapy makes her heart worse. Chemotherapy name, lot number, NDC and expiration date: Not provided. The Pfizer covid vaccine made her heart worse. She is supposed to get chemotherapy tomorrow. She does not know what will happen tomorrow. She thinks that her doctor is going to have to up her medications. She has been seeing her heart doctor every week. Because of radiation, she has not seen her as much. She is going to see her heart doctor on Tuesday. Her heart doctor has been doctoring her for forever, and she sees her every week since she was diagnosed with cancer. She prefers for Pfizer to contact her heart doctor if there are any follow up questions. She had to have surgery, and after that she went into A-Flutter. Her heart doctor has been on it since. Clarified that her heart medications normally do work. She thinks that the COVID vaccine counteracted her heart medications. Normally her heart rate is under 100. After the COVID vaccine, at 7:00PM, her pulse was 104. On Saturday, at 4:30PM, her heart rate was 111. At 8:00PM, it was 109. On Sunday, it got better. At 7:30AM, it was 96. At 6:00PM, it was 90. On Tuesday, whenever the injection site turned red, was hurting and swollen, her heart rate was 104. Currently her heart rate is 94. She has A-Fib and A-Flutter. She has been doctoring that every week about that. After that she was fine. On Monday, 11Apr2021, she had radiation. After radiation, on Tuesday, 13Apr2021, her arm at the injection site was swollen, red, hurting and tender to touch. Her heart started beating fast again. The redness is the whole width of her arm. She is asking how long she can expect this redness to last. She does not know if radiation triggered this. It happened right after radiation that she started on Monday. Her daughter told her that this is normal, and a lot of people have this happen. The day before the second dose of the COVID vaccine, she had internal radiation. That was her third radiation treatment. She told her oncology doctor about the COVID vaccine and her doctor talked to her about it. Her doctor told her to go on and get the COVID

vaccine, and that people like her needed the vaccine. She did not have radiation with first dose of the COVID vaccine. Therapeutic measures were taken as a result of bad headache and fever of 99.4, 99.7, and 100.8. The outcome of the events sickness, fever, chills, feeling abnormal, body aches and feeling unwell was recovered on 11Apr2021, headache was recovering, while of the rest was unknown.

CDC Split Type:
Write-up: Initial symptoms after administration was low level soreness, localized to injection site on right arm and dissipated after 2 days. Delayed onset rash appeared 7 days after injection. Rash began about 2 inches in diameter, characterized with redness, itchiness and warmth. Area was slightly raised/swollen and firm to the touch. Over the next two days (8-9 days after injection) rash grew to about 4 inches in diameter, redness and itch was present but dissipating slowly. Appears likely to resolve within the next couple days. Treatment included OTC hydrocortisone cream, applied once the first day rash appeared. No other treatments were used.

CDC Split Type:
Write-up: Patient called my attention. Stated he was very hot. I could see he was sweating and pale. I asked if there was any itchiness or difficulty breathing. He replied no but he felt nauseous. I retrieved a trash can in case he vomitted but he did not. The feeling of nausea passed pretty quickly. I retrieved ice packs for his neck and wrists. he laid his head in his hand resting on the ice

packs on his wrist. His first BP reading was 99/68... repeated in 10 minutes...about the same.I stayed with him & had him put his feet up. We conversed through most of the event. Next reading was 110/74. His color was coming back a little but he was still hot and a little woosy. Patient gave me permission to call his supervisor. I advised his supervisor he would benefit from going home to rest vs working the remainder of shift. I also contacted management to advise the same. He stayed sitting for a total of @ 50 minutes. Two more BP readings were 106/74 and 108/74. I had him stand he said he was okay. He had to walk to back of store to get his belongings. I asked him to come back to pharmacy before leaving. He said he felt much better and had been okay walking to back of the store. I did call him # 2.5 hours later and he said he was feeling okay. He did say that this has happened before..not always . I told him to let them know when he rec"d 2nd dose.

CDC Split Type:
Write-up: About 5 minutes after I received the shot, had a sudden burning sensation in the middle of my chest that radiated out. I thought that was it for me. Nausea, dizziness, numbness in my left cheek and arm, got a funny taste in my mouth. This got pretty intense and lasted about 10 minutes. They had me stay in observation for another 45 minutes as those symptoms came in waves but never as intense as the first time. They let me go and I went home to rest. On the way home my cheeks became flushed and it felt like my eyes and cheeks were swelling. I had a lot of other symptoms over the next several hours which I wrote down. Early Tuesday morning those symptoms went away and I was left with some flu like symptoms, dizziness and a brain fog like I have never had before.

Write-up: administrated subcutaneously with the second dose of Shingrix; This case was reported by a pharmacist via call center representative and described the occurrence of intramuscular formulation administered by other route in a 59-year-old female patient who received Herpes zoster (Shingrix) (batch number 9H3Z4, expiry date 27th August 2022) for prophylaxis. On 29th April 2021, the patient received the 2nd dose of Shingrix (subcutaneous). On 29th April 2021, unknown after receiving Shingrix, the patient experienced intramuscular formulation administered by other route. On an unknown date, the outcome of the intramuscular formulation administered by other route was unknown. Additional information was provided as follows: The patient received a dose of Shingrix subcutaneously instead of intramuscular route which led to intramuscular formulation administered by other route. No adverse event was reported. The reporter consented to follow up.

Write-up: administer your vaccine subcutaneously instead of IM; This case was reported by a pharmacist via call center representative and described the occurrence of intramuscular formulation administered by other route in a female patient who received Herpes zoster (Shingrix) for prophylaxis. On an unknown date, the patient received the 2nd dose of Shingrix (subcutaneous). On an unknown date, unknown after receiving Shingrix, the patient experienced intramuscular formulation administered by other route. On an unknown date, the outcome of the intramuscular formulation administered by other route was unknown. Additional details were provided as follows: The age at vaccination was not reported. The reporter stated, one immunizer administered Singrix vaccine subcutaneously instead of intramuscularly to the patient, which led to intramuscular formulation administered by other route. The reporter asked if any guidance was helpful, they were wondering if any harm was done and if patient should be getting her second dose again just to maintain full coverage. The reporter did not have DOB (date of birth) at time of chat and stopped responding when asked for more vaccine details (date of administration, lot and expiry date). No further information was reported The reporter was unable to obtain permission for follow up.

Other Medications: Pepcid Birth control Vitamin D gummies
Current Illness: None, but had side effects after my 1st dose as well; however, these have been more intense
Preexisting Conditions: Mild CP Acid reflux Overactive bladder IBS/issues with wheat/gluten
Allergies: Unknown at this time, but strong cause to think allergic to dairy and some forms of soy; have been GF since August 2019 due to adverse side effects of wheat/gluten
Diagnostic Lab Data: EKG - 4/29/2021 - all fine
CDC Split Type:
Write-up: After the 1st dose, I had a headache, sore arm, sore joints and fatigue for exactly a

week after the shot was administered. It''s been a week since dose 2, and my side effects have been worse. Migrane, body aches, arm soreness, fatigue, cough/hoarse/post nasal drip and having chills to feeling like I was burning. It started when I lost my voice about 3 hours after injection, and worsened over the following 3 days before starting to get better a few days ago Still have a headache and am sore, though, with hoarseness in my voice and a dry throat. Trying to sleep for longer and drink plenty of water. Went to the Dr. due to spitting blood on Thursday morning. Was informed it was just post nasal drip, but still had to have an EKG done due to a racing heart. Everything looked fine, but I''ve been in contact with them re: my symptoms in the following day. Glad to be doing my part for public health, but these have gone on awhile!

Diagnostic Lab Data:
CDC Split Type:
Write-up: About 36 hours after receiving the first dose of the COVID vaccine, I began to have a rash around left eye (red, very itchy, swollen) accompanied by swollen lymph nodes on the left side of my body. This rash has not diminished in the 2+ weeks since, but has in fact gotten progressively worse. It is now around both of my eyes (though my eyes themselves seem fine - it''s just the skin around them, both above and below), and is debilitatingly painful and itchy. In addition, 2 days post-vaccine, my lips became very swollen and red and numb/tingly. This is also continual. 1 week ago I broke out in itchy welts all over my scalp, and now my whole body is very itchy. Nothing else in my diet / skin care routine / medications / etc has changed in the last 2+

weeks, with the exception of some antihistamines I have begun taking in the last few days. I spoke with my PCP today and shared my concerns - primarily that this is progressively getting worse and more systemic - and he suggested I file this form. He also recommended that I not receive the 2nd dose of COVID, as this reaction is already significantly impacting my quality of life and my health (I am unable to work full days because of the discomfort, and I am experiencing significant insomnia as a result of the same).

Write-up: Prior to administering the vaccine, the patient had expressed an intense phobia of needles to pharmacy staff, and this was communicated to the pharmacist. After administering the vaccine, the patient stated that they felt lightheaded. The pharmacist then asked the patient if they wanted to remain seated, and the patient lost consciousness for approx. 60 seconds. Per Pharmacy protocol, code white, (indicating injury) was declared over the stores radio system. The patient was lowered onto the floor, legs were elevated and cold compress applied as per protocol. Following the patent regaining consciousness, they declined paramedic assistance and was provided with an electric cart to aid in leaving the premises.

Other Medications: METFORMIN; GLIZIDE [GLICLAZIDE]; ATORVASTATIN CALCIUM; JANUVIA [SITAGLIPTIN]
Current Illness: High cholesterol (Verbatim: High cholesterol); Type 2 diabetes mellitus (Verbatim: Type 2 diabetes)
Preexisting Conditions: Medical History/Concurrent Conditions: Heart attack (Verbatim:He says

his dad died of a heart attack .)
Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021432238
Write-up: couldn"t eat anything/could eat cereal and maybe some ramen noodles, he couldn"t eat anything; tired; sweating; This is a spontaneous report from a contactable consumer(patient). This 65-year-old male patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EN0158) at single dose on 13Apr2021 13:30 via an unknown route in left arm for Covid-19 immunization. Medical history included Type 2 diabetes and high cholesterol, both ongoing. He had probably had Type 2 diabetes a lot longer than he thought. He was diagnosed with Type 2 diabetes in 2001 or 2002. He said his high cholesterol was pretty much in check because he stays on his pills. He says he has no clue how long he has had this condition, 39 years all over a year, that he probably had it while he was in Korea. His dad died of a heart attack. Concomitant drugs included metformin for cholesterol and had been taking this probably since "99 (as reported), gliclazide (GLIZIDE)(reported as "extra large (XL)") for type 2 diabetes taking this since probably about the time they discovered he had type 2 diabetes, atorvastatin calcium been taking this since the same as gliclazide for type 2 diabetes, and sitagliptin (JANUVIA) from Mar2021 for type 2 diabetes, all ongoing. Historical vaccine included 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EN6208) on 23Mar2021 10:30 AM in left arm for Covid-19 immunization and had no issues or side effects. History of all previous immunization with the Pfizer vaccine considered as suspect was reported a "NA". No additional Vaccines Administered on Same Date of the Pfizer Suspect. No Prior Vaccinations (within 4 weeks) and no AE(s) following prior vaccinations. He received his second vaccine dose on 13Apr2021 and on 15Apr2021 he began experiencing sweating. He stated he had been sweating up a storm, changing clothes 3 times a day. He said that didn"t happen before the second shot. He denies fever and chills. Patient also experienced tired from 16Apr2021 and couldn"t eat anything from 17Apr2021. Reporter seriousness for the events sweating, tired and couldn"t eat anything was unspecified. Sweating happened 1 day right after he got the shot, which was probably "Wednesday" night, then it went away, then "Friday, Saturday, Sunday, last night" he had to change clothes 3 times. He still had to change clothes last night (as of 19Apr2021). He was so tired he couldn"t even eat, he could eat cereal and maybe some ramen noodles, he couldn"t eat anything, he didn"t feel like it. He was tired "Friday" afternoon. His grandkids got up and he felt like bleh. He said some days he gets up and feels fine, then he sweats, then he felt fine. On 19Apr2021 he got up and felt fairly decent. "Saturday" morning he couldn"t eat anything, bacon and eggs he can"t eat, he made a bowl of cream of wheat. No Emergency Room or Physician Office visit due to the events. No relevant tests performed. Outcome of tired was unknown. Outcome of the other events was not resolved. Follow-up attempts are completed. No further information is expected.

Write-up: 4/11 11:30 vaccination 11:40 I felt had a head rush and my heart started pounding like it never had before. I reported back to the EMTs on site. They monitored me. After another 10 minutes, I was not feeling better, nauseous. My BP rose and I went into a fibrillation. They transported me at that time to the ER. The Afib went away on its own. It was probably an hour at the mobile clinic and ER ride; by the time I had arrived my afib had resolved on its own. Discharged Heart palpitations over the next few weeks. The following Sunday, I started to feel like I was going back into Afib. By the time I got there, everything was ok. They sent me home with a heart monitor for 48 hours. I will get the information on 5/7/2021. *5/7/2021 follow up appointment with PCM to find results of HR monitor.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient called the pharmacy 5/6/21 to question a rash on her arm where she received her COVID vaccine. She stated that she did have a red wheel around the injection site and mild pain after her 4/22/21 vaccine but the redness faded after 5 days. She said that she woke up this morning (5/6/21) and noticed a rash on both arms and redness around the injection site. I told her that I wouldn''t know if she was experiencing hives unless I saw the rash. She said that she needed to stop by the store today and would stop by the pharmacy. A few hours later, patient presented to the pharmacy. I observed her rash. She has a large wheel of redness on her left deltoid the size of a lime. She has a red, spotted rash on her bilateral arms and states that she does not have the rash elsewhere on the body. Patient states the rash does mildly itch. I told her I did not believe that she was experiencing hives but referred her to her physician to determine if it

could be a delayed reaction to the vaccine. Patient visited her physician this afternoon and returned to the pharmacy with a prescription for triamcinolone cream. She also had a letter in hand from her physician stating she was medically cleared to receive her second dose of Moderna vaccine.

Diagnostic Lab Data:
CDC Split Type: USGLAXOSMITHKLINEUS202109
Write-up: First dose of Shingrix on 30/Oct/2019 and has not received dose two; This case was reported by a pharmacist via call center representative and described the occurrence of incomplete course of vaccination in a elderly male patient who received Herpes zoster (Shingrix) for prophylaxis. Previously administered products included Shingrix (received 1st dose on 30th October 2019). On an unknown date, the patient received the 2nd dose of Shingrix. On an unknown date, unknown after receiving Shingrix, the patient experienced incomplete course of vaccination. On an unknown date, the outcome of the incomplete course of vaccination was unknown. Additional details were provided as follows: Age at vaccination was not applicable for this report. A pharmacist reported that a patient received the first dose of Shingrix and had not received dose two which led to incomplete course of vaccination. The reporter consented to follow up.

Write-up: On The April 21 I had one quarter size mark that was itchy. Thought I got bit by a spider. It didn''t go away. A week later I had three quarter size red marks on left hip in a triangle pattern. Needed to get second shot and figured these were not related to the vaccine. After receiving second shot in the arm it bleed. Person held pressure on it and told me it would bruise . This was on May 2nd at 8:10 am. It was lot number EW0167. Clinic site. Received medical care at express care for spreading rash and itching on Tuesday May 4th. 20mg twice daily. Was placed on predizone 40mg, Zrytec 20mg twice daily, Benadryl 50mg every 6 hours, famotidine May 8th still spreading on thigh toward knee. Chicken pox like marks on stomache and back. Going to medical center today May 8th.

CDC Split Type:
Write-up: Started with tongue becoming numb (4/27)and by next day (4/28) his face was sagging and he couldn''t feel the left side of his face - called PCP and they suggested he go to the ER to rule out stroke . While there they diagnosed him w Bell''s Palsey and issued prednisone and an anti viral (not sure of name). said to reschedule 2nd does 10 days out so rescheduled for 5/10. On 5/10 Husband called PCP office as his ear has been bothering him to see if he should still get his 2nd dose - Nurse called back and said they don''t suggest it . He has PCP follow up on 5/13 - rescheduled 2nd does later that day in hopes he can receive it for full vaccination . As of 5/11 he can kind of blink on left side and can open his mouth more . mentioned that side of his face feels sore / bruised

CDC Split Type:
Write-up: Patient was sitting after receiving the vaccine. The patient had a hairy arm and the inject safe bandage had come up from the skin on one side. The injection site had some bleeding and the patient looked over and passed out at the sight of blood about 5 minutes after receiving the vaccine. The pharmacist went over and rolled the patient over and he regained consciousness immediately. After talking to the patient to make sure they were alert and ok they had patient slowly sit up and eventually sit in a chair. Paramedics also came and patient denied going with them to the ER. The patient remained sitting until they had his girl friend pick him up.

Current Illness: None
Preexisting Conditions: Seasonal allergies
Allergies: NKA
Diagnostic Lab Data: Echocardiogram 5/11/2021 Cardiac cath 5/11/2021 Cardiac MRI 5/12/21
CDC Split Type:
Write-up: Patient by 5/8/21 was experiencing fever to 103, lower back pain, palpitaitons, headache, nausea, left arm and neck pain and dizziness. He was taking Advil and Tylenol to assist with symptom managment. Left arm and neck pain persisted. On the morning of 5/11/21 he awoke with central chest tightness, left arm/shoulder/neck achiness, nausea and headache. During ride to hospital, he had palpitations for 30 minutes. He arrived at Medical Center where he was found to have a positive troponin I of 4.2 (ULN of <0.045). Echo done at that time showed EF of 59% with basal inferior, anterolateral hyokinesia, basal inferolateral hyokinesia, mid inferolateral hyokinesia, diastolic LV function normal function for age and trace mitral regurgitation. ECG showed non diagnostic ST elevations in leads II, III, AVF. The patient was transferred to another Medical Center for urgent cardiac cath based on resting chest, arm and neck pain, positive troponin and wall motion abnormalities seen on echo. Cardiac cath found normal coronary arteries that were free of disease. Troponin I at this medical center was positive 0.31 and 0.39. Further testing ordered is a cardiac MRI to assess for possible acute myocarditis.

Current Illness: Right hip pain which I assumed was from Lyme disease for which I was treated in November, 2020.

Preexisting Conditions: Graves? disease
Allergies: Meds: penicillin, cephalosporins, ibuprofen, imitrex Food: tree nuts, peanuts, avocado, shellfish allergy; gluten intolerance Other: latex
Diagnostic Lab Data:
CDC Split Type:
Write-up: On 5/8/2021 I awoke several times with muscle spasms in my legs. On 5/9/2021 I noticed that my left 2nd toe was numb. Over the next three days the numbness spread to the 3rd and 4th toes, and adjacent skin on the dorsal aspect of the left distal foot. There is no motor deficit, only sensory. On 5/12/2021, I first experienced extreme tenderness over the lateral aspect of my left neck, at the site of the brachial plexus. On 5/13, this same extreme tenderness in my left axilla at the site of the brachial plexus. On 5/15 a raised, tender red welt appeared over the vaccination site on my left deltoid, and I noticed a few hives on my left upper extremity.

CDC Split Type:
Write-up: Moderna COVID-19 Vaccine EUA. No adverse reactions from first shot March 16, 2021. This reporting concerns the second dose April 14, 2021. Two weeks later I experienced locking and pain in both shoulders but more severe on the left side where the injection occurred. The shoulders would not rotate then "popped" , motion returned and the pain subsided. The pain was quick and intense. Second issue, a similar locking pain across the shoulder blades that literally stopped my breathing until the pain subsided. Third issue, a similar cramping pain in the toes of both feet while walking, again slowly subsiding. All of these issues have occured daily since the second Moderna injection. I have contacted my primary care doctor for an appointment as well as reporting this here.

Current Illness:
Preexisting Conditions: Hashimotos disease
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Initial fatigue, muscle soreness starting at ~3pm. Slept until 9/10 am following day. Following day continued to be exhausted, low energy, unable to perform regular tasks. on Monday, 5/17 developed sudden face rash, concentrated largely on one side, spread over the nose, and a little bit on the other cheek as well. Rash was raised symmetrical bumps, smaller than a quarter centimeter with pussy-filled whiteheads, and swelling particularly concentrated around the nose. Rash was itchy and hot. Eyes were dry and itchy. Rash persisted through the evening/night, and the swelling went down (still visible) for the following morning.

Previous Vaccinations:
Other Medications: Multivitamins, CoQ10, turmeric
Current Illness: None

Preexisting Conditions: Joint pain
Allergies: Celexa
Diagnostic Lab Data: The doctor did blood work, took blood work, and took a urine sample. My blood work came back normal. My urine came back normal. My blood pressure and pulse were elevated, probably because of the pain I was experiencing, according to the doctor.
CDC Split Type: vsafe
Write-up: I got my shot on 4/1/2021. I woke up on 4/2/2021 at 6 AM. I didn''t feel right. I felt kind of dizzy and lightheaded. I got up and had a few sips of water, but my stomach did not really feel right. I lay back down and fell right to sleep. I woke up again around 11:30 AM. I had a severe headache and sensitivity to light, and I felt really sick to my stomach. I had a cup of chicken rice soup and went back to bed. And then I slept until 8:30 AM on 4/3/2021. I still didn''t feel well, so I called the on-call doctor and told him my symptoms. I got there at about 12:00 PM on 4/3/2021, and they took me in. They did blood work and checked my vitals, plus a urinalysis. They gave me an IV, because they thought I might be dehydrated. After all the test results came back, the doctor felt my illness was not caused by the COVID vaccine. I was having a migraine. I''ve had them previously, but it felt different from prior migraines. The doctor gave me Botox injections. I got home at about 7:00 PM on 4/3/2021.

CDC Split Type: USPFIZER INC2021503786
Write-up: redness in the back of the patient''s throat and blisters or ulcers; Redness in the back of the patient''s throat; He can talk a little bit better, but it''s still sore; Throat lesions; He developed this ulcer on his tongue and throat; He developed this ulcer on his tongue and throat; Difficulty swallowing; Ear feels plugged; This is a spontaneous report from contactable consumer (patient). A 67-year-old-male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not provided), via an unspecified route of administration on Apr2021 at 1st dose, single for COVID-19 immunization. The patient''s medical history and concomitant medications were not reported. The patient experienced throat lesions on an unspecified date in 2021 which got worse over the weekend. He was able to speak to his healthcare professional (HCP) and recommended the second dose. He was prescribed amoxicillin for throat lesions and mentioned that he was on the way to the appointment for second dose. He asked if he could receive the second dose. The patient had his first vaccine about 1 month ago (Apr2021) and is due to get second dose today (05May2021) in about 30 minutes. The last few days (2021), he developed ulcer on his tongue and throat, difficulty swallowing, and his ear felt plugged. He went to the doctor on 04May2021 and the doctor said he saw redness in the back of the patient''s throat and blisters or ulcers and put him on an antibiotic. As the patient has been reading up more, he saw that was one of the symptoms being reported after the vaccine. He was wondering if he should or shouldn''t get the second dose as scheduled today relative to these events. It did seem like today he could talk a little bit better, but it''s still sore (2021). The outcome of the event throat lesion and throat ulcer was not recovered and unknown for all other events. No follow-up attempts are needed; information about lot/batch number cannot be obtained.

Write-up: Pt received vaccine and went to sit for 15 mins. After about 5 mins she walked over to Drop Off and stated she wasn''t feeling well. She began to faint and the technician who was close to her ran over and caught her as she fell. I immediately called 911 while technician took care of pt. She regained consciousness in less than 2 mins. EMS arrived and took her to the ambulance for observation.

Other Medications: Vit D, no other meds
Current Illness: None
Preexisting Conditions: None
Allergies: None
Diagnostic Lab Data: None - would have gone to MD but too many activities happening and symptoms cleared I think. I still get little transient symptoms but very subtle.
CDC Split Type:
Write-up: Five days after the second COVID dose I experienced what I thought was motion disturbances similar to a head concussion (week long symptoms) I had six months ago. When I looked into what brain fog was with the vaccine it was very evident that was what was going on. I actually did not realize how bad it was until much later when it cleared. Difficulty focusing and having to repeat processing events that has never happened before. Difficulty sitting and following conversation after an hour need to get up and leave. Still some motion dizziness when turning head fast or downward such as putting on shoes.

Allergies: Unknown, recent (1-2 yrs) allergy to bees/wasps/hornets
Diagnostic Lab Data: N/A - have not sought medical treatment, will wait to see if it goes away in a couple days.
CDC Split Type:
Write-up: Covid arm. Small rash at the injection site, larger round rash about 4 inches circumference about 4 inches lower than the injection site almost over bicep. Developed the next day to a couple days after the shot, it''s itchy, red and a little swollen. It was all over my arm the second day, with my arm being very red and swollen so I assumed that was the immediate reaction/side effect. A couple days later the new rash position developed and is itchy, a little swollen, and very red. It''s a little painful as well.

Diagnostic Lab Data:
CDC Split Type:
Write-up: One week after receiving the vaccine I woke up on 5/21 with a mild rash. As the day went on the rash progressed and swelling of lips and uvula occurred around 5pm. I was taken to an urgent care who transferred me to a hospital via rescue. I spent the night at the hospital receiving multiple epi pen injections, and fluids. I was discharged 5/22 with a dose of prednisone. I was fatigued all day. On 5/23 I woke up to swollen eyes and lips and covered in hives again. I went to the ER where I was given steroids and fluids again. The hives went down but did not go away. One 5/24 I took multiple doses of Benadryl and dose of prednisone and in the evening time the hives progressed. Today 5/25 I woke up with swollen lips and checks and hives. I went to my doctors office to be evaluated.

Current Illness: N/A
Preexisting Conditions: High blood pressure, anxiety
Allergies: N/A
Diagnostic Lab Data: N/A
CDC Split Type:
Write-up: First noticed redness, hot to the touch, swelling, rash around injection site and down left arm to above the elbow on Tue. 5/18. Thought it was a bug / spider bite so treated it accordingly. By Fri. 5/21, it had not gotten better so reported it to V-Safe after identifying the symptoms online as "COVID Arm". Started approximately 6 days after the vaccine was administered. Information online states that symptoms should be gone after a couple days but it has now been a week since they first appeared. Left arm is getting better but rash is still visible above the elbow with some tenderness and a little warm to the touch. I wanted to report this due to the length of time I have

had it and how long it is taking to clear up.

Current Illness:
Preexisting Conditions: Migraines and low iron.
Allergies:
Diagnostic Lab Data: 5/22/2021: Blood work, EKG, Chest X-Ray, and CT, results reassuring.
CDC Split Type:
Write-up: Chest pain and back pain around heart area and shortness of breath started Saturday morning, 5/22/2021, at 11:00am. At 2:30, decided to go to ER as pain was not getting better. Had blood work, EKG, Chest X-Ray, and CT with contrast done. Advised all tests seemed ok. Diagnosed with Inflammation, possibly pleurisy. Prescribed Ibuprofen 600mg up to 4 times a day and rest. Follow up with primary care if symptoms don?t improve in 3-5 days with treatment. To date, symptoms come and go, but seem worse when lifting anything heavy or getting stressed out. Sometimes, symptoms such as chest pain or shortness of breath happen when lying down, or getting up, or doing normal activities, like cooking and cleaning.

Previous Vaccinations: reported his 5 1/2 to 6 days flu-like symptoms to CDC and Moderna
Other Medications: Qvar 80 mcg (Beclomethasone Dipropionate HFA) Patient died of Bacterial Endocarditis on May 6th, 2021. Could there be a vaccine
Current Illness: Absolutely none. Had been hunkered down since March 21, 2020 (that''s 2020 --- twenty). We were extremely COVID careful. He might have had very mild case of Covid in early February 2020. He died of Bacterial Endocarditis on May 6, 2021. Timing just seems a bit questionable. See if you find overtime and increase of Bacterial Endocarditis post Covid vaccines, please.
Preexisting Conditions: None other than the slight allergies, asthma(very slight). Only took half his Qvar dose a day because worked for him fine. So he took half of the prescribed dose, think the lowest you could take(?)
Allergies: no, just to dogs, cats, etc no medication, food, or other products allergies that we are aware of
Diagnostic Lab Data: Medical center May 4, 2021 to May 6, 2021. Patient died of Bacterial Endocarditis on May 6, 2021. May not be connected to vaccination but could be so, please, look for more incidence (higher than normal rates) of Bacterial Endocarditis following Covid vaccination, please.
CDC Split Type:
Write-up: MIGHT NOT BE LINKED TO VACCINE but, please, watch for Bacterial Endocarditis following Covid vaccinations. On-set following vaccination seems suspicious but might be coincidental. He died of Bacterial Endocarditis on May 6, 2020. First weird symptoms began March 10, very slight chills after going out for a walk. He had had pretty strong flu-like symptoms began 4 1/2 days after first vaccine dose and lasted 5 1/2 to 6 days (we reported to CDC and Moderna). Then he felt great for 3 days, then weird little symptoms began. Please, just put in data base to look for trends. He most likely had a very very mild case of Covid in early to mid February 2020. Lasted 3 days with fatigue and diarrhea only. Thank you very much

Diagnostic Lab Data:
CDC Split Type:
Write-up: Developed transverse myelitis. She began to develop numbness in her feet starting 4/30 which worsened over several days. She presented to the emergency department and had a normal CBC, CMP, TSH. Normal vital signs. However on her exam she had decreased but not absent sensations in bilateral lower extremities to the mid calf, lack of positional sense of her bilateral toes. She had a lumbar puncture which showed 160 white blood cells with an 83% lymphocyte predominance but without elevated protein or glucose alteration the numbness found a ascending to just below her breasts at that time she was having no sensory or motor symptoms in her arms, no visual disturbance speech or swallowing difficulty. She was aware of bowel and bladder sensation but unable to sense her self urinating or defecating. She was listing to the left while walking. Her B12 was noted to be low at 232 and she was started on a B12 supplement. She is negative for Covid, RSV, influenza A and B. She also had her cerebrospinal fluid evaluated for IgG and oligoclonal bands. She was after having MRIs of her brain, C-spine, T-spine with and without contrast she was started on Solu-Medrol for 5 days. Imaging had no specific findings suggesting the diagnosis, Dr felt that she likely had some mild myelitis. She did improve with the Solu-Medrol. Since returning home patient has been feeling better but still has some limitations. Still has some limited sensation from her abdomen downward, gait is a little unsteady. The balls of her feet still feel numb, and she is to be very cautious about her footwear and how she walks.

Current Illness:
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient is a 66 y.o. female with an unknown PMHx admitted with DKA and found to have thrombocytopenia, an intraparenchymal bleed on Head CT 2/2 to dural venous thrombosis. Course also complicated by saddle submassive PE w/ + biomarkers and mild RHS. Given unclear etiology of thrombocytopenia, venous thrombosis, and PE, suspect a precipitating/underlying etiology and cannot rule out possible occult malignancy, autoimmune disorder or alternative hypercoagulable state such as APLS. Possibly bacteremic given GPB and Staph on blood cx, though likely contaminant. DKA resolved, anion gap is closed, continued monitoring of glucose and insulin adjustment .OB/Gyn following for heavy vaginal bleeding and possibly gyn malignancy workup, endometrial biopsy pending. Heme also following.

Previous Vaccinations:

Other Medications: I take 20mg Fluoxetine 1 daily and 300mg of bupropion.
Current Illness: I did not have any other illnesses.
Preexisting Conditions: I get migraines.
Allergies: I am allergic to sulfa drugs and a medication called Valtrex.
Diagnostic Lab Data: I was tested for COVID and Lyme disease. COVID came back negative and I never received the result for the Lyme disease test. I also had a kidney function test and a white blood cell test that came back normal.
CDC Split Type: vsafe
Write-up: I started noticing a headache and my neck got really stiff about 5 minutes before I started vomiting violently. I felt better for about 30 minutes after vomiting, but I started vomiting again. I started to have blinding pain in my head. By 6pm, I was having muscle and joint pain so I went to the ER. I tested negative for COVID. I received some IV drugs, but I"m not sure of the name. I was also tested for Lyme disease, but I never received the results. Nothing was confirmed about my adverse event, but it was guessed that I was experiencing migraines. I also received IV fluids. Around midnight I felt better and was released from the ER.

Previous Vaccinations:
Other Medications: Lithium carbonate- 1200mg ER- Bed Time - 150mg Morning Trazadone - 200mg - 1xday Modafinil - 200mg - 1xday
Current Illness: Chronic cough still after first vaccination
Preexisting Conditions:
Allergies:
Diagnostic Lab Data: X- Rays of hands/ feet/ pelvis/ lower back/ chest CT Scans lungs (pulmonary specialist). Blood Work
CDC Split Type: vsafe
Write-up: Day after receiving the second dose, I started experiencing a fever, on top of the cough from first dose, with an increase of pain over my body, night sweats, discoloration in my feet. I saw my PCP again, they did an Auto Nuclear Antibody test that was positive and had a high Tighter level. PCP then referred me to a Rheumatologist, where they did more testing of blood work, X-Rays of hands/ feet/ pelvis/ lower back, CT Scans lungs (pulmonary specialist). PCP did a chest x-ray prior to Rheumatologist. I had to see an ENT Dr. do to a growth in my nose, had to get it tested and it is Aplasia (non- cancerous). I also had multiple non-healing ulcers all over my body. A Dermatologist could not determine what they were so they gave me a topical cream for them. Now waiting to see an Ophthalmologist. I now have a lung physical therapist, occupational therapist for my lungs. Neurologist is going to do a ENG test (next week), podiatrist for my feet. I have also lost a lot of weight and have a Dietician as well. I am still experiencing all of these symptoms since February. I cannot work or able to practice at all.

Diagnostic Lab Data: Unknown
CDC Split Type:
Write-up: I administered the vaccine and asked patient to move to the waiting area for his 15 minute observation period. He moved out to the chair and sat down about 2 minutes later his abdomen started to move back and forth a few times and then he started to have what appeared to be a seizure. It was very short (20 seconds), he remained in the chair. His mom and I moved him to the floor with his help. He then mentioned that he forgot to take his seizure medication last night and was feeling very nervous about the vaccine.

Other Medications: Children''s Multivitamin;she has an inhaler - but she hasn''t taken it in over a year
Current Illness: no
Preexisting Conditions: Eczema; she was diagnosed with asthma but hasn''t used an inhaler for over a year.
Allergies: skin sensitivity: scented soaps or laundry soaps
Diagnostic Lab Data: no
CDC Split Type: vsafe
Write-up: She had a rash after school - she noticed it about 2:00 - she started getting a headache and around 03:00 - she noticed a rash (red marks - no bumps) on her knees and upper and thighs. About 3:20 - her right arm and a little bit on her left arm were almost like hives (bumps) - they were a little bit itchy off and on. The next morning, could still the bumps but not as bad, but on 19th after school it was back just like the day before. We gave Benadryl to see if that would help. In the morning it goes away - on her arms, she can see a little a bit of where the lumps are - not as bad; on legs it''s just almost completely gone, and by afternoon it''s back to full scale of

where it had been the night before. Could see where the bumps were in her arm but it is not as bad as it was. Today, as far as I know from the last time I asked her, she said there are still some on her arms but not on legs.

CDC Split Type: USPFIZER INC2021293792
Write-up: Swelling around eyes; Redness around eyes; This is a spontaneous report from a contactable consumer, the patient. A 63-year-old non-pregnant female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA vaccine; Lot number: UNKNOWN), via an unspecified route of administration in the right arm on 15Mar2021 at 12:00 hours as a single dose for COVID-19 immunisation (age at vaccination 63-year-old). On an unknown date, the patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA vaccine; Lot number: UNKNOWN), dose 1, single, via an unspecified route of administration and anatomical location for

COVID-19 immunisation. Medical history included intermittent atrial fibrillation. Concomitant medication was not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine, and medications within two weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 17Mar2021 at 05:00, the patient experienced swelling and redness around eyes and the swelling shut when patient awoke in the same morning. The clinical outcome of swollen eyes and eye redness was recovering at the time of this report. No follow up attempts are possible. No further information is expected; information about Lot number cannot be obtained.

Write-up: In the shot area it started to itch; In the shot area it was slightly swollen; Some soreness; it was quite swollen very hot; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received second dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/Lot Number and Expiration date not reported) via an unspecified route of administration on 26May2021 as 2nd dose single for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The Historical vaccine included first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/Lot Number and Expiration date not reported) via an unspecified route

of administration on unspecified date as 1st dose single for COVID-19 immunization. On Wednesday 26May2021 at 11:30 (withheld), the patient received second dose of vaccine and on Friday the patient had itch and it was slightly swollen in the shot area. The patient reported late yesterday it started to swell a lot more and noticed that and a clockwise night (not clarified) it was quite swollen very hot, and it was still hot next morning, and it itches. There was some soreness, and it was not terribly serious. The patient noticed that, if the hand was not moved the itching stops and the patient did not feel anything except it was art (not clarified) the patient can put whole hand with fingers pressed and it covers the whole area of the swelling, the heat and the itching and was not sure what to do about it. The patient did not think it was anything serious as far as concerned but did not know anything about it and do have concern. The patient does not have a computer and the other person made the arrangements for COVID Shot (COVID Vaccine) and the patient received the second one. The patient asked that What to do about it, Will it go away or gradually go away. The patient asked was it okay to keep doing what patient was doing, was it safe for the patient for this to happen, was the patient okay and will it go away. The patient was to have to hang up because not getting anywhere. The patient was getting very, very nervous and very frustrated and the patient was elderly and cannot take this. The patient was going to get a hold of the person who made the arrangements the vaccine and go online use website to reach. The patient was not in a good position, was on oxygen and cannot do that. The outcome of had itch and it was slightly swollen in the shot area was unknown and outcome of some soreness and it was quite swollen very hot was not resolved. Information on the Lot/Batch number has been requested.

Preexisting Conditions: Medical History/Concurrent Conditions: Cerebral palsy (Verbatim: cerebral palsy)
Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021267849
Write-up: just a swollen eye and rashes; just a swollen eye and rashes; shingles around her left eye; This is a spontaneous report from a contactable consumer (patient) and physician. A 71-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: solution for injection, Batch/Lot Number: EN6203),via an unspecified route of administration, administered in Arm Left on 24Feb2021 13:00 (at the age of 71 years old) as 1st dose, single dose for COVID-19 immunization. Medical history included cerebral palsy, from an unknown date and unknown if ongoing. No history of previous immunization with the Pfizer vaccine considered as suspect. No Additional Administered Vaccines on same date with the Pfizer vaccine considered as suspect. No prior vaccinations within 4 weeks. Concomitant medications included phenobarbital 32.4 mg, daily, [32.4mg tablet 1 tablet per day by mouth at bedtime] taken for convulsions (taken about 30 years if not 40 years), start and stop date were not reported. The patient previously took Shingles vaccine (2016) and flu shot (1991, for 30 years with no problems). The patient reported that she had first vaccine on 24Feb2021, and she was to have second vaccine shortly. The patient stated that she got shingles in between and thought she should let Pfizer know. She wanted to get the second vaccine and said she was not afraid. The patient state that she was dying to get the vaccine. It was probably at 8:15AM when she could sign up for the COVID 19 vaccine, then she got an earlier appointment, and she was so excited she went up there 2 hours early but then the shingles happened. The patient stated that probably because she also had cerebral palsy, so that could have made shingles happen. The doctor had her go because they thought it was shingles around her eye. So, she went to an eye doctor. The patient stated that she started to call Pfizer but waited a long time today and was sicker then. She did get the shingles on the weak side of her body and the side she got her shot on. The patient stated that it could have been cerebral palsy that caused it to come out. Shingles is pain in the body, but she had no pain just a swollen eyes and rashes. The patient state that she got an antiviral drug and she thought she was going to be really and saying that COVID would not be able to hit her with vaccine and antivirals. The shingles are almost gone. She was scheduled for second COVID 19 vaccine on 17Mar2021 at 8:20AM. The patient stated that she thought her body was weaker than the most people but trying to live as normally as she can. Sometimes stupid things happen because she was not quite as strong. She reported that state started the comorbidity alliance. She did not think cerebral palsy is considered a comorbidity because it was physical. The patient was taking antiviral Valacyclovir 1 gram, 1 tablet 3 times a day by mouth in a 7-day supply. Her doctor told her to go to the emergency room to get her eye checked. Her left eye was her better eye. She still had perfect vision in the left eye, 40/20 or 20/40 whichever it was, she did not remember. The patient stated that was what happens when you get 70. She took the shingles vaccine at pharmacy in 2016 but then she read other things that say maybe it was only 50% accurate or that it would hold, she was debating getting the Shingrix vaccine. She had been out of the house only about 1% of the time for the whole past year. She clarified that she had been quarantining. She states that she was very anxious to get the other COVID 19 vaccine because if she had both vaccines, she could help others along the line. The patient visited emergency room/physician office. The patient received treatment for the events. The outcome of the events shingles around

her left eye was recovering and just a swollen eye and rashes was unknown. No relevant tests. Investigation Assessment: No. No follow-up attempts are possible. No further information is expected.

Previous Vaccinations:
Other Medications: zyrtec as needed
Current Illness: none
Preexisting Conditions: asthma
Allergies: none
Diagnostic Lab Data: MRI, lab work
CDC Split Type:
Write-up: On 4/6 my son noticed changes with his vision which continued to 4/7 at which time we brought him to his pcp. She referred us to his eye doctor. They got him in that afternoon, did an exam, told us to follow up that Friday. At the 4/9 follow up he was diagnosed with sixth nerve palsy on the left eye. We scheduled a MRI and lab work. Lab work came back fine. He went for the MRI on 4/16. The MRI showed several brain lesions pointing towards MS. We went to a medical center on 4/20 where they thought the finding lesion were incidental and not related to MS. We saw a neuro-opthamologist on 4/21, who said he felt my son did have MS with sixth nerve palsy. We saw a neurologist on the afternoon of 4/21 who said patient didn''t meet the criteria of MS and to follow

up another MRI in 3 months. That weekend patient started with areas on numbness. He was due for second covid injection which all providers agreed with us getting. He got his second dose on 4/24 during this flare of numbness. We went back the neurologist on 4/26. Patient was given a three day iv steroid infusion, lab work and follow up MRI. The follow up MRI showed more lesions in his brain which lead us to the neurologist in another state. Dr reviewed both MRIs, felt the lesions were incidental, the flare of numbness as well at the sixth nerve palsy of his eye were related to inflammation related to the vaccine he received.

Write-up: Fainted off the toilet/again fainted; Felt incredibly ill; Throw up; Diarrhea; This is a spontaneous report from a contactable consumer (patient). A 30-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, administered in Arm Left on 17Apr2021 13:00 (30 years old at vaccination) (Lot Number:

EW0161) as single dose for covid-19 immunisation. The patient was not pregnant at the time of vaccination. Medical history included Allergy: Bees. Concomitant medication(s) the patient received within 2 weeks of vaccination included drospirenone, ethinylestradiol betadex clathrate (YAZ). Clinical course as reported: Sunday 18Apr around midnight I felt incredibly ill (roughly 30 hours after vaccine). I went to the bathroom and fainted off the toilet and then proceeded to throw up and have diarrhea at the same time while on the floor. After showering and cleaning up, roughly 30 minutes later I again fainted (this time in the safety and easy cleaning of the bath tub) and repeated the same throw up/diarrhea episode. I slept in the bathtub for the rest of the night. My doctor instructed me to go to the emergency room if I fainted again and to drink plenty of fluids. Events onset date reported as 18Apr2021 12:00 PM. No treatment received for events. Outcome for event was recovered on unspecified date in 2021. Serious reported as No. The patient was not diagnosed with COVID-19 prior to vaccination, and Since the vaccination, the patient has not been tested for COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Information on Lot/Batch number was available. Additional information has been requested.

Write-up: experienced anaphylaxis after receiving the second dose; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received second dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/Lot number and expiration was not reported), via an unspecified route of administration on an unspecified date as single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Previously, patient received first dose PFIZER-BIONTECH COVID-19 VACCINE (Batch/Lot number and expiration was not reported), via an unspecified route of administration on an unspecified date as single dose for covid-19 immunisation. On an unknown date, the patient reported that as someone who experienced anaphylaxis after receiving the second dose of your COVID vaccine, she was wondering whether Pfizer was attempting to modify future RNA vaccines, in particular the booster, so that they were less likely to cause allergic reactions. She hoped she will not need to forego the benefits of this wonderful new technology in the future and said thank you very much. The outcome for was unknown. Information about the Lot/batch number has been requested.

Previous Vaccinations: Severe flu-like symptoms for five days following Shingrix, 7/18/2019, age 64
Other Medications: Levothyroxine, calcium + D3, multivitamin with iron
Current Illness: None
Preexisting Conditions: High cholesterol, migraines, peripheral neuropathy
Allergies: Keflex, penicillin, doxycycline, crabs
Diagnostic Lab Data: No lab results. Tested for BPPV on April 31, March 1, April 12, April 30, and at least twice more (not sure of dates).
CDC Split Type:
Write-up: No symptoms until about 5 hours after vaccination, then felt mildly ill for the next few days (fatigue, slight achiness, loss of appetite). At midnight on the fourth day after the vaccination (March 29), felt extreme vertigo when turning over in bed. Woke up that morning (March 30) and still had extreme vertigo (had to crawl to bathroom). Had had vestibular migraines in the past, so assumed that was the cause, but this was much more severe and unrelenting. Saw nurse practitioner the following day (March 31), who diagnosed BPPV (benign paroxysmal positional vertigo). Saw physical therapist that afternoon, who confirmed diagnosis but was unable to provide treatment because of the extremity of the symptoms. Treated (apparently successfully) April 1, and was told that I "might feel lousy for a few days." Did not substantially improve until approximately June 12, but then plateaued and had two further recurrences, leading to second appointment with NP, plus one to two physical therapy sessions a week. Continuing to have mild symptoms, but have improved over the past week.

Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021619844
Write-up: Seizure; I had bitten my tongue; This is a spontaneous report from a contactable consumer (patient). A 20-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number: EW0191) via an unspecified route of administration, administered on the left arm on 27May2021 14:45 as 2nd dose, single for COVID-19 immunisation. Medical history included Type 1 diabetes, epilepsy and PCOS. Concomitant medications included insulin aspart (NOVOLOG); insulin glargine (LANTUS); levetiracetam (KEPPRA); drospirenone, ethinylestradiol (OCELLA) and cran-stat. The patient previously received first dose of BNT162B2 on 06May2021 for COVID-19 immunization (lot number: EW0173, on 06May2021 01:30 PM, left arm). On 28May2021 11:30 AM, the day after 2nd shot the patient woke up on the kitchen floor. She believed she had a seizure because she couldn''t remember falling and she had bitten her tongue. No treatment was received for the events. Patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Since the vaccination, the patient has not been tested for COVID-19. Prior to vaccination, the patient was not diagnosed with COVID-19. Outcome of the events was recovered on an unspecified date.

Current Illness: Patient began experiencing upper respiratory tract infection symptoms

approximately three days prior to receiving second dose of moderna COVID 19 vaccine on 6/4/21, this illness lasted approximately until 6/12/21 when his URI symptoms seemed to resolve. However he had persistent shortness of breath, lightheadedness, and palpitations starting around 6/12-6/13 which ultimately brought him to the emergency department on 6/15/21.
Preexisting Conditions: Described palpitations through adolescence into adulthood, but never formally diagnosed with anything. No other past medical history to date.
Allergies: No allergies to medications
Diagnostic Lab Data: Initial lab work and tests upon presentation notable for EKG with AFIB and rates in 160-200s. D Dimer 4829, troponin 0.059, CT angio of the chest demonstrating pulmonary edema. CRP 19.1, BNP 7500, WBC 13.27. COVID 19 PCR test negative. Further work up still pending.
CDC Split Type:
Write-up: Patient received second dose of Moderna COVID 19 vaccine on 6/4/21. During this same time, patient also had URI diagnosed as bronchitis at an urgent care and provided albuterol inhaler. Cough and URI symptoms subsided on approximately 6/12/21 but developed SOB, lightheadedness, and palpitations thereafter prompting presentation to ED on 6/15/21. Patient was started on digoxin, heparin, and furosemide by cardiology team. Work up in progress.

Diagnostic Lab Data: Autopsy of the baby Blood tests of both parents
CDC Split Type:
Write-up: *COVID-19 Vaccine dose #2 was given on 4/16/21 **TDAP booster was given on 3/10/21 I had no side effects after any of the vaccinations. I had a bit of a sore arm after the TDAP and the first COVID-19 vaccination but that was it. I didn''t even have a sore arm really at all after the second COVID-19 shot. I did have a bandaid mark that lingered for a few days after the second COVID-19 shot but that was it. I was 30 weeks and 6 days pregnant during the first COVID-19 shot. I felt the baby kicking normally after that and had normal follow up appointments after that too. My entire pregnancy was completely normal (this was my first pregnancy) with no complications or issues. I felt great throughout the entire pregnancy and was active biking, working out, walking, etc. I would consider myself a very healthy and active person and I followed all of the pregnancy "guidelines" in terms of what to eat, what not to eat, etc. The adverse event here is the fact that my baby was stillborn at 39 weeks and 4 days. The appointment with the doctor the week before was totally normal too. What the doctor *thinks* happened is that my amniotic fluid somehow disappeared in the final few days before going into labor (they don''t know where it went - my water did not break prior to the delivery of the baby) and the lack of fluid caused the baby to pass meconium. The high level of meconium surrounding her and the amount of time she was exposed to it seem to have degraded the umbilical cord, affecting her oxygen flow. By the time I went into labor, she may have already been dead, though I did not know it. When I got to the hospital in labor, there was already no heartbeat. Baby delivery date: 5/26/21 Weight: 6 lbs 9 oz Length: 21 in The mystery here is why was there suddenly a lack of fluid and why did that cause her to pass so much meconium? The doctors do not know and there does not seem to be a way to share this information with other doctors or facilities to gain a better understanding.

Write-up: Diarrhea; This is a spontaneous report from a contactable consumer, the patient. A 77-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE BIONTECH, Lot number: EL3247), via an unspecified route of administration in right arm on 02Feb2021 at 00:00 (at the age of 77-years-old), and second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE BIONTECH, Lot number: EN6200), via an unspecified route of administration in right arm on 25Feb2021 as a single dose for COVID-19 immunisation. The patient''s medical history included IBS, diabetes insipidus, gastroesophageal reflux disease (GERD), osteoarthritis, hypertension and high cholesterol on an unknown date. Concomitant medications were not reported. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient did not have any allergies to medications, food or other products. The patient did not receive any other medications within two weeks of vaccination. On 02Feb2021, the patient experienced diarrhea lasting from first dose to current date 18Mar2021 which was uncontrolled by budesmide. The patient had undergone treatment with budesmide for diarrhea. The outcome of the event diarrhea was not recovered at the time of reporting and had resulted in Doctor or other healthcare professional office/clinic visit. No follow-up attempts are needed. No further information is expected.

Diagnostic Lab Data:
CDC Split Type: vsafe
Write-up: I experienced a rash about three weeks after my J&J vaccine. I also experienced a full body rash, not on my palms or soles of my feet or face but I did have the rash everywhere else. It was itchy, on a scale 6-7 out of 10 on VAS scale, persistent, pervasive and my PCP diagnosed me with pyrethrum rosacea. There was a patch on my back examined by my PCP. My PCP told me it would go away on its own, also gave me a prescription Aciclovir, low dose (25mg) for treatment. As far as today, my rash is still present, comes and goes and I have mild itchiness in more areas of my body and also the back of my knees.

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: Almost 2000 people had a similar reaction (not the redness)/hearing loss response; Almost 2000 people had a similar reaction (not the redness)/tinnitus; similar reaction; This case was initially received via an unknown source (no reference has been entered for a health authority or license partner) on 23-Apr-2021. The most recent information was received on 28-May-2021 and was forwarded to Moderna on 28-May-2021. Based on the current case data, this case has been classified as invalid. This spontaneous case was reported by a consumer and describes the occurrence of DEAFNESS (Almost 2000 people had a similar reaction (not the redness)/hearing loss response) in a patient of an unknown age and gender who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On an unknown date, the patient received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On an unknown date, the patient experienced DEAFNESS (Almost 2000 people had a similar reaction (not the redness)/hearing loss response) (seriousness criterion medically significant), TINNITUS (Almost 2000 people had a similar reaction (not the redness)/tinnitus) and VACCINATION COMPLICATION (similar reaction). At the time of the report, DEAFNESS (Almost 2000 people had a similar reaction (not the redness)/hearing loss response), TINNITUS (Almost 2000 people had a similar reaction (not the redness)/tinnitus) and VACCINATION COMPLICATION (similar reaction) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant medications were reported. No treatment information was provided. Very limited information regarding these events have been provided at this time. Most recent FOLLOW-UP information incorporated above includes: On 28-May-2021: Follow- up received added new events which upgraded the case to serious.; Sender''s Comments: Very limited information regarding these events have been provided at this time.

Diagnostic Lab Data:
CDC Split Type: USGLAXOSMITHKLINEUS202113
Write-up: Its been over a year since the first vaccine; This case was reported by a other health professional via call center representative and described the occurrence of incomplete course of vaccination in a patient who received Herpes zoster (Shingrix) for prophylaxis. Previously administered products included Shingrix (received 1st dose on an unknown date a year ago prior to reporting). On an unknown date, the patient received the 2nd dose of Shingrix. On an unknown date, unknown after receiving Shingrix, the patient experienced incomplete course of vaccination. On an unknown date, the outcome of the incomplete course of vaccination was unknown. Additional details were provided as follows: The age at vaccination was not applicable for this report. Till the time of reporting, patients did not received 2nd dose of Shingrix, which led to incomplete course of vaccination. The Health care professional reported that patients had received 1st dose of Shingrix more than a year ago. The health care professional inquired that if they can restart the Shingrix series. No further details were provided. The reporter consented to follow up.

Current Illness:
Preexisting Conditions:
Allergies: Mild reactions to penicillin
Diagnostic Lab Data:
CDC Split Type:
Write-up: Just acute arm pain after first vaccine After the second vaccine, I experienced horrible menstrual cramps and heavy bleeding (very unusual). I''ve had 3 periods since my second vaccine, and I am still experiencing menstrual changes- very painful cramping prior to actually getting my period. This is uncommon. I usually have slight cramps after bleeding for a short period of time, but the last 3 periods I''ve gotten really painful cramping before. The cramps start about 3 days before, and have continued for at least 2 days once I''ve started my period.

Write-up: I am finding my ability to stand, walk, or hold my arms above my head for any period of more than a few minutes difficult. Yesterday I was unable to hold myself upright sufficiently to sit in a kayak (never got to find out for how long could I try to paddle). Mentally I am constantly having short-term memory challenges, for example just recalling the word fatigue to describe my situation I have had to write on a note paper as I repeatedly forget the term until I read it. Bringing groceries from our vehicle into the house I am finding near impossible (what used to take 1-2 minutes has taken me over 15 in the past 3 weeks on multiple occasions). I find myself falling asleep repeatedly during work, even though I am sleeping well at night. Some days are better than others, with a strong correlation to temperature.

Other Medications:
Current Illness: None
Preexisting Conditions: No
Allergies: Percocet and Codeine Weird reaction to Wellbutrin
Diagnostic Lab Data: None
CDC Split Type:
Write-up: Dose 1: I went out to eat after and on the drive home, I started to feel weird. Almost like I shouldn?t be driving. Foggy, tired, eye lids were heavy, almost felt drunk or withdrawing from drugs. (Similar to when I was prescribed Cymbalta and forgot to take one, years ago. But much worse.) I went home and laid down. My heart was racing. I felt nauseous. I didn?t feel like I had control over my thoughts, if that makes sense. My chest hurt. My mouth was watering. It was scary. I slept for 11.5 hours, on and off. I had a hard time staying asleep. I woke up in the morning feeling much better, but my arm hurt pretty bad and I was still exhausted and nauseous. I stayed home from work. The next day, I felt more myself, but my arm still hurt. Dose 2: I expected to feel the same or even worse after this dose, so I planned to go straight home and lay down and took the following day off from work in advance. I went straight home and waited, but I felt fine. I went to bed at my normal time. Slept fine. Woke up fine. I thought I got lucky. I called and told work that I?d be in. I had a calm morning, but then we did a fire drill at 9:45am or so. After the fire drill, I started to feel weird again. All of the same symptoms. By 10:30, I told my boss I needed to leave. I felt paranoid. I had a couple hallucinations. I was falling asleep. I was scared to be working. I felt guilty for putting my boss in this predicament. I wasn?t able to get coverage until about 1pm. By then, I was terrified of driving home, but forced myself to. I live 2 minutes away. I told my kids that I didn?t feel well and went to sleep. My heart was racing. All of the same symptoms plus these, but all heightened. I kept telling myself that they would go away. I just needed to sleep. So, I did. Again on and off, it was hard to stay asleep. My Fitbit showed that my heart rate was elevated once the symptoms started and the entire time I was sleeping. I woke up feeling exhausted again. Nauseous. This time, my arm felt like I was shot with a gun. I took the day off from work. My arm actually still doesn?t feel the same today.

Write-up: So I had the shot on March 28, 2021 and let''s see if I can remember the date, I''ll get my calendar which will help me a little bit, so it started the end of April 2021. I noticed a difference in my breathing, I had not been active and I just didn''t feel very good. On the 28th of April I was feeling very weak, feeling like a wimp, I couldn''t do anything without feeling very exhausted. Then on May 5 2021 I told my husband I just was not feeling right, I had to sit down just when getting dressed. I went to the bathroom and I felt like something was really wrong, I could not even walk around without feeling tired. On May 5 2021 I called my son who is an RN and he took my BP and heart rate, but my oxygen was 91 and then 87 again when he tested again. He said he felt I had a pulmonary embolism, they called my cardiologist. The DR told me to go to the hospital and they did an EKG and took me to an ER room to do a chest x-ray. They said there was something on my chest so they did bloodwork. He then said I had blood clots on both my lungs. Then later on that night they did ultrasounds of my legs. They found a deep vein thrombosis. They then broke the news that I was not going home, that they were going to admit me. I ended up in a monitored room for four days. They put me on oxygen and wires. 4,000 units of heparin drip w/ 2,0000 units per hour. They then switched me to Luvanox and Coumadin. They could not figure out why this happened to me. They found no infections, nothing cancerous or anything. They sent me home with blood thinners (coumadin) all the time. Then two weeks later I woke up in the middle of the night with a lot of pressure on my chest and I went to the ER again. I was never admitted, they just checked me. Then two weeks later again it happened and I went to on call, they took pictures of my heart and everything again and they could not find anything. They did a study of sleep on me and they found I have a sleep apnea problem. They are recently now working on my sleeping problem and I will be admitted and studied over night on the machines. In between all this I also went to my PCD and now that is to current, up to date is what has been happening recently.

Previous Vaccinations:
Other Medications: Magnesium taken infrequently, probably 3 to 4 times per month.
Current Illness: N/A
Preexisting Conditions: Headaches, suspected migraines bc it runs in the family but never tested.
Allergies: Cashews, Coolwhip, cranberries
Diagnostic Lab Data: N/A
CDC Split Type:
Write-up: Woke up at 3:30 am from period cramps. Went to the bathroom as this was the start of my period and I didn?t have a pad on. After going to the bathroom I was washing my hands and became nauseous which I have never experienced on my period. I became lightheaded, cold sweats and vomited bile. I have good reason to believe the vomiting was not due to my period because I have never vomited due to my period. I took peptobismol for the nausea and ibuprofen for the pain and then went to sleep.

Previous Vaccinations: tetanus shot - huge, red swollen arm - long time ago - late 80''s
Other Medications: Ibuprofen
Current Illness: no
Preexisting Conditions: no
Allergies: anaphylactic reaction to Latex and related foods - avocado; jicama; papaya; penicillin; Levothyroxine; Gel caps; reacted to the tetanus vaccine
Diagnostic Lab Data: I had all at the Hospital - had most of the test at this facility and another medical center where I had the pulmonary CT and where they found the lung stuff 19th of June - COVID test was negative
CDC Split Type: vsafe
Write-up: On May 27th, I had an episode of double vision and light headedness and my blood pressure was up. Not quite confusion but just strange. They thought it might be a mini stroke - so I had an MRI or MRA - showed vascular changes but showed no acute stroke and carotids were okay. Also did an EKG with some changes and a repeat EKG - and that one seemed like a normal EKG. I had an echocardiogram - on Tuesday; Coronary CT on Wednesday and radiologist called my primary care doctor and said there was a "broken glass" opaqueness (opacity) of left upper lobe. This Wednesday with the chest x-ray, I''m concerned - I have been short of breath and tired lately - just not feeling good. On May 28th, I started Lisinopril for blood pressure and also started aspirin. My blood pressure is still fluctuating. I''m waiting for a lung CT to be scheduled - Pulmonary function study to be schedule and that''s a couple of weeks out. I haven''t had another

episode of double vision. Fatigue and short of breath and I have had some diarrhea. I had had some weird GI stuff all winter long but it restarted (diarrhea) 2 weeks ago. I hadn''t had it for four months or so.

Allergies: Amoxicillin
Diagnostic Lab Data: Full blood panel 5/24 was inconclusive. Checked B12,,thyroid, Lyme and many other possibilities.
CDC Split Type:
Write-up: Significant neuropathy in toes, feet and up through ankles as well as a numb patch just below knees. Along with the numbness is tingling, pins and needles, and muscle twitching, Also experiencing intermittent burning feelings in finger and decrease in overall sensation in arms, hands and fingers. A similar loss of sensation is occurring around my collar bone and along my neck. These symptom were first noticed on April 23rd (I checked my web searches to see when I first looked up neuropathy in the feet) and have only been getting progressively worse. My PCP is unsure about what is happening and is currently and it is placing it under the familiar diagnosis of idiopathic. I am currently pursuing acupuncture. Both my PCP and acupuncture provider have stated that they are seeing an uptick in this sort of symptom profile!

Write-up: On Jan. 13th, I had stomach pain and it was hard to concentrate at work. I started getting a bad headache on the 14th when I was at work as well. I spoke to a nurse and they told me to monitor my symptoms. I felt fine on the 16th though. On the 25th, I experienced stomach pain again. I was also coughing and had a dry cough, throat clearing, and diarrhea. Later after work, I spoke to my Primary Care doctor and then I talked to my employee health provider. I was told to not return to work and then I took a Covid-19 test on the 26th. The test came back negative. I was cleared to return back to work. On Feb. 3rd, I did take additional tests at Medical Center. My dietician did state some of my symptoms could be related to high Fodmap.

Write-up: Started my period in the evening the same day vaccine was administered. It was two weeks early. My periods are regular and last for three days with light flow. I have had heavy flow for eight days. I am still bleeding. In addition I had severe vertigo and mild fever for five days after receiving the vaccine beginning on day two and ending on day 6. I could not move my head

without significant spinning sensation. The vertigo has now subsided. I have never experienced vertigo in my life. It was debilitating. Thankfully it has subsided. My mother who is 74 also experienced vertigo after both her first and second Covid vaccination - Pfizer. She still has vertigo in the mornings three months after the second vaccine.

Current Illness: No
Preexisting Conditions: Takayasu arteritis
Allergies: No
Diagnostic Lab Data: MRI"s: normal; Blood panel: normal
CDC Split Type: vsafe
Write-up: I had fatigue and shortness of breath. I had shortness of breath on exertion. I was concerned because I am a lung cancer survivor, and I am already missing half a lung. I also have Takayasu arteritis which can affect any artery. I had 7 MRI"s done to make sure all my arteries are okay. I was referred to a pulmonologist and I will be seeing her on July 20th. I have had pulmonary embolism in the past and this shortness of breath is not as drastic as that. The fatigue is limiting and is now different that what it was initially. It was getting better and then reoccurred worse than before.

Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021336831
Write-up: LT deltoid redness, radiating to LT side of chest; full face flushing; This is a spontaneous report from a contactable other healthcare professional, the patient. A 59-year-old non-pregnant female patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, Lot Number: ER8730), via an unspecified route of administration in the left arm on 23Mar2021 at 13:30 (at the age of 59-years-old) as a single dose for COVID-19 immunisation. Medical history included breast cancer for which she was on aromatase inhibitor. Concomitant medication included exemestane (MANUFACTURER UNKNOWN), Vitamin d (MANUFACTURER UNKNOWN) and calcium (MANUFACTURER UNKNOWN); all for unknown indication. The patient had a history of allergy to iodine contrast dye. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccine. On 23Mar2021 at 14:15, the patient had experienced left deltoid redness which was radiating to left side of chest and full-face flushing. The patient also reported that it lasted approximately for 90 minutes. Adverse events did not result in a visit to the doctor or other healthcare professional office/clinic visit, and emergency room/department or urgent care. The clinical outcome of the events left deltoid redness, radiating to left side of chest and full face flushing was resolved on 23Mar2021 at 15:45. No follow-up attempts are needed. No further information is expected.

Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021563829
Write-up: Did get a sore arm with her 1st dose; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Solution for injection; Lot number: EW0158) via an unspecified route of administration in left arm on 07Apr2021 at 14:00 (at the age of 44-year-old) as single dose for COVID-19 immunization. Medical history of the patient was not reported. Concomitant medication included multivitamins [besides a multivitamin patient does not take anything on a regular basis and sees the HCP once a year; states she does not get sick often and was pretty healthy, eats well, takes vitamins and has an occasional glass of wine]. Patient previously received flu vaccine for immunization and has soreness in her arm. On an unspecified date in 2021, the patient experienced a sore arm with her 1st dose, the arm soreness was for a couple of days or so and was gone. It was reported that she has no name of the flu vaccine she had a sore arm with and no lot number, expiry date or NDC to provide and states the flu shot tends to cause soreness the same day and then she is fine and the Pfizer COVID19 1st dose she was sore a couple of days but it did not prohibit her from doing anything and was just noticeable. AE"s does not require a visit to: Emergency Room, Physician Office. No Prior Vaccinations (within 4 weeks) administered. Outcome of the event was resolved on an unspecified date in 2021. Additional information has been requested.

Write-up: About a month after the vaccination, I went for a physical and the doctor mentioned I had arrhythmia. I didn''t think too much about it until later when I had more issues. A few months later, another doctor also mentioned my pulse was really low and my heart rate was erratic and to see a cardiologist. I went for a follow up for a sleep test and again my pulse was very low and my heart rate was erratic and I was sent to the ER. My symptoms, I could feel flutter in my chest and SOB and couldn''t get a full breath. In the ER they did a bunch of tests, EKG, ECHO and recommended a 24 hour heart monitor. I was discharged with a diagnosis bigeminy which is 2

extra heart beats and to follow up with PCP and cardiologist. I did do a 24 hour heart monitor and I am waiting for consult with cardiologist.

Previous Vaccinations:
Other Medications: Beachbody Shakeology (Chocolate Vegan) Maca powder Vitamin D
Current Illness: I was sick with side effects from the vaccine which started about 12 hours after getting vaccinated. I was "down and out" for about 48 hours -- achy, tired, extreme headache, weakness. A few weeks later I had stabbing back/rib pain (which I think was from sleeping incorrectly). This seemed to start the tingling.
Preexisting Conditions: A few weeks after the vaccine I"ve noticed tingling in my arms and legs. It started out with my left arm and would sometimes stay isolated in my left hand. Then it started to travel up and down my left arm. After a few days I seemed to get it symmetrically (and at the same time) up and down my right arm. Then my left leg joined in. Same symptoms at the same time on the back side of my arms and legs. And then after a few days, my right leg joined in: all four limbs experience mild tingling along the backs of the arms and legs. The tingling comes and goes at the same time. Over time, the symptoms have gotten better, but they are still there. The right arm is not involved as much any more. Mostly now just the backs of the legs. However, the left arm still comes in to play when I"m laying on my stomach or swimming breast stroke, or sitting down to the computer at the desk or when washing dishes. (When my arms are at 90 degrees.) There is minimal tingling in my arms as I type this to you now, but there is tingling in the backs of both legs. A tingling -- a coolness.
Allergies: None known.
Diagnostic Lab Data: None

Diagnostic Lab Data: Test Date: 20210322; Test Name: Body temperature; Result Unstructured Data: 97.5

CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: Rash that was itchy; Red; Burns (Red Bumps area on the neck); Depressed level of consciousness; Abdominal cramping; Chills; Mild Headache; Red Bumps Right Side of the Neck / front on my neck was red with a rash/Red bumpy rash covering the front of my neck; Burning sensation; Lethargic; No energy/ low energy; Sore left upper arm shot site; Felt Tired; Throwing up/Vomiting; Stomach burning; This spontaneous case was reported by a consumer and describes the occurrence of DEPRESSED LEVEL OF CONSCIOUSNESS (Depressed level of consciousness) in a 61-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002A21A and 021B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concomitant products included VITAMIN C [ASCORBIC ACID] and CURCUMA LONGA (TURMERIC CURCUMIN [CURCUMA LONGA]) for Immune disorder (NOS), MULTIVITAMINS [VITAMINS NOS] for an unknown indication. On 19-Mar-2021 at 3:30 AM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 16-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 19-Mar-2021 at 8:30 AM, the patient experienced DYSPEPSIA (Stomach burning). On 19-Mar-2021 at 8:45 AM, the patient experienced VOMITING (Throwing up/Vomiting). On 20-Mar-2021, the patient experienced LETHARGY (Lethargic), ASTHENIA (No energy/ low energy), VACCINATION SITE PAIN (Sore left upper arm shot site) and FATIGUE (Felt Tired). On 21-Mar-2021, the patient experienced RASH MACULAR (Red Bumps Right Side of the Neck / front on my neck was red with a rash/Red bumpy rash covering the front of my neck). 21-Mar-2021, the patient experienced BURNING SENSATION (Burning sensation) and HEADACHE (Mild Headache). On 22-Mar-2021, the patient experienced DEPRESSED LEVEL OF CONSCIOUSNESS (Depressed level of consciousness) (seriousness criterion medically significant), ABDOMINAL PAIN (Abdominal cramping) and CHILLS (Chills). On 26-Mar-2021, the patient experienced SKIN BURNING SENSATION (Burns (Red Bumps area on the neck)). On an unknown date, the patient experienced RASH PRURITIC (Rash that was itchy) and ERYTHEMA (Red). The patient was treated with HYDROCORTISONE at a dose of UNK dosage form and LEVOCETIRIZINE DIHYDROCHLORIDE (LEVOCETRIZINE HYDROCHLORIDE) from 23-Mar-2021 to 27-Mar-2021 for Rash, at a dose of 1 DF. On 22-Mar-2021, VOMITING (Throwing up/Vomiting) had resolved. On 23-Mar-2021, HEADACHE (Mild Headache) had resolved. On 27-Mar-2021, RASH MACULAR (Red Bumps Right Side of the Neck / front on my neck was red with a rash/Red bumpy rash covering the front of my neck), LETHARGY (Lethargic), ASTHENIA (No energy/ low energy), FATIGUE (Felt Tired) and CHILLS (Chills) had resolved. At the time of the report, DEPRESSED LEVEL OF CONSCIOUSNESS (Depressed level of consciousness), DYSPEPSIA (Stomach burning), RASH PRURITIC (Rash that was itchy), ERYTHEMA (Red), SKIN BURNING SENSATION (Burns (Red Bumps area on the neck)), BURNING SENSATION (Burning sensation), ABDOMINAL PAIN (Abdominal cramping) and VACCINATION SITE PAIN (Sore left upper arm shot site) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 22-Mar-2021, Body temperature: 97.5 (normal) 97.5. mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosing remained unchanged. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Based on the current available information and temporal association between the use of the product and the events, a causal relationship cannot be excluded. This case was linked to MOD-2021-255837 (Patient Link). Most recent FOLLOW-UP information incorporated above includes: On 13-Jul-2021: New events depressed level of consciousness, dyspepsia, rash pruritic, erythema, lethargy, asthenia, burning sensation, abdominal pain, vaccination site pain, fatigue and chills were added. Treatment medication and concomitant medications were added. Action taken was updated.; Sender''s Comments: Based on the current available information and temporal association between the use of the product and the events, a

causal relationship cannot be excluded.

Write-up: Chills at 75 degrees; This is a spontaneous report from a contactable consumer, the patient. A 67-year-old male patient received second dose of BNT162b2 (PFIZER BIONTECH COVID-19 mRNA COVID-19 VACCINE; Lot number: ER8727), via an unspecified route of administration in left arm on 24Mar2021 at 07:00 (at the age of 67-year-old) as a single dose for COVID-19 immunisation. Medical history included type 2 diabetes. There were no known allergies. The concomitant medications included sitagliptin phosphate (JANUVIA), metformin (MANUFACTURER UNKNOWN) and rosuvastatin (MANUFACTURER UNKNOWN) for an unknown indication. The patient previously received first dose of BNT162b2 (PFIZER BIONTECH COVID-19 mRNA COVID-19 VACCINE; Lot number: UNKNOWN), via an unspecified route of administration on an unknown date as a single dose for COVID-19 immunisation. The patient had not received any other vaccines within 4 weeks prior to COVID-19 vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient was not tested for COVID-19 since receiving the vaccine. On 24Mar2021 at 18:00, the patient experienced chills at 75 degrees. The patient had not received any treatment for the event chills. The events did not result in doctor or other healthcare professional office/clinic visit, and emergency room/department or urgent care.

The clinical outcome of the event chills was unknown at the time of the report. No follow-up attempts are needed. No further information is expected.

Previous Vaccinations: Mild redness on injection site for flu vaccine.
Other Medications: Ibuprofen.
Current Illness: None.
Preexisting Conditions: Psoriasis.
Allergies: Shellfish.
Diagnostic Lab Data: Ultrasound to right lower quadrant and kidney and didn''t see anything for appendicitis. I still have had the pain. Bloodwork for electrolyte panel was done.
CDC Split Type: vsafe
Write-up: So the evening before, my friends and I had a gathering, the next AM, I was having a lot cramping right lower quadrant, and feel my abdomen pressing on it worse. I was hoping it would go away. I was feeling nausea, I laid in bad and didn''t go to work that day. I didn''t get better after a few days. Normal bowel movements. I thought I among have an appendicitis.

Diagnostic Lab Data:

CDC Split Type:
Write-up: ? At approximately 6:50PM vaccine was administered. ? Within 10 minutes of the dose being administered, patient began vomiting. ? At approximately 7:03PM, RN attempted to assess patients pulse. RN determined pulse to be approximately 100 BPM but was difficult to be confident as the pulse was indistinct. Another RN also attempted to collect a pulse and was not confident in a reading. Oxygenation and heart rate was attempted to be collected using a pulse oximeter. A reading could not be determined. Additionally, a temperature could not be collected using an infrared thermometer. Upon observation, the patient appeared pale and diaphoretic. He did not present or report difficulty breathing at any time. Patients skin was cool to the touch. Patient reported to his parents that he felt nauseous and cold. ? At approximately 7:08PM patient was offered juice. ? At approximately 7:10PM RN observed that nail bed began to become discolored, slightly blue. RN requested call 911. ? EMS onsite by 7:15PM. EMS vitals included, o BP 131/88 o HR 103 o Resp. 24 o O2 Sat 98% o Temp 98.4 ? Family declined glucose screen and transport to emergency department as patietn began to report feeling better. Patients color improved. ? EMS, family, and staff left scene at approximately 7:50PM. ? RN connected with patients father on 7/16/21. Father reported that patient was doing much better, slept through the night with no issues. Patient was still sleep when father left for work that morning, however, father looked in on him. Per fathher, his color appeared good and he was sleeping well. Father wondered what gauge needle was used for the procedure. He stated he thought is was long and perhaps a 1 ? ? size. RN assured it was a 1? needle as the type of set-up used was a complete set-up with a standard 1? needle.

Current Illness: Sulfonamide allergy
Preexisting Conditions:
Allergies:
Diagnostic Lab Data: Test Date: 2021; Test Name: MRI; Test Result: Negative ; Result Unstructured Data: Negative
CDC Split Type: USMODERNATX, INC.MOD20212
Write-up: Sick for the two days; Had period the following week and was extremely emotional and had a heavy period; Felt awful the rest of the day; Extremely emotional; Seizure; Not feeling well;

Twitching my hands.; This spontaneous case was reported by a consumer and describes the occurrence of SEIZURE (Seizure) in a 33-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 038c21a and 019b21a) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Sulfonamide allergy. Concomitant products included ETHINYLESTRADIOL, LEVONORGESTREL (VIENVA) from 15-Mar-2021 to an unknown date for Birth control, MINERALS NOS, VITAMINS NOS (ONE A DAY [MINERALS NOS;VITAMINS NOS]) from 01-May-2015 to an unknown date and COLLAGEN from 15-Mar-2021 to an unknown date for an unknown indication. On 19-Apr-2021 at 3:00 PM, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 17-May-2021 at 3:00 PM, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 06-Jun-2021, the patient experienced MALAISE (Not feeling well) and MUSCLE TWITCHING (Twitching my hands.). On 06-Jun-2021 at 2:30 PM, the patient experienced SEIZURE (Seizure) (seriousness criterion medically significant). On an unknown date, the patient experienced ILLNESS (Sick for the two days), HEAVY MENSTRUAL BLEEDING (Had period the following week and was extremely emotional and had a heavy period), FEELING ABNORMAL (Felt awful the rest of the day) and EMOTIONAL DISORDER (Extremely emotional). At the time of the report, SEIZURE (Seizure), ILLNESS (Sick for the two days), HEAVY MENSTRUAL BLEEDING (Had period the following week and was extremely emotional and had a heavy period), MALAISE (Not feeling well), MUSCLE TWITCHING (Twitching my hands.), FEELING ABNORMAL (Felt awful the rest of the day) and EMOTIONAL DISORDER (Extremely emotional) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In 2021, Magnetic resonance imaging: negative (Negative) Negative. Company Comment: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Very limited information regarding the event has been provided at this time. Most recent FOLLOW-UP information incorporated above includes: On 16-Jul-2021: Follow Up document was received and had significant information. Added Lab data. On 18-Jul-2021: Follow-up document was received and had significant information. Added vaccine facility, patient demographics, medical history, concomitant medications, event start date. Added new events like sick, heavy period, not feeling well, hand twitching, emotional.; Sender''s Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded. Very limited information regarding the event has been provided at this time.

Current Illness:
Preexisting Conditions: Medical History/Concurrent Conditions: Obesity; Shingles (patient was diagnosed with shingles in November 2020)
Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021366521
Write-up: Itching; Pain; Shingles; This is a spontaneous report from a contactable consumer, the patient. A 68-years-old non-pregnant female patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: en6205) via an unspecified route of administration in the arm left on 19Mar2021 at 09:00 (at the age of 68-years-old) as a single dose for COVID-19 immunisation. Medical history included shingles in Nov2020 and obesity. Concomitant medications included ibuprofen (MANUFACTURER UNKNOWN) from unknown date for unknown indication. Patient had no known allergies to medications, food, or other products.

Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 24Mar2021 after receiving vaccine, the patient had shingles pain and itching. The patient did not received any treatment for reported events. The events did not result in doctor or other healthcare professional office/clinic visit, and emergency room/department or urgent care. The clinical outcome of the events shingles, itching and pain was not recovered. No follow-up attempts are needed. No further information is expected.

Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: I have discomfort and itching in the nerves of my hands & feet. See "neuropathic itching" - an itching sensation not on the surface of the skin that is remedied by scratching, but a sensation of tickling/itching deeper in the body. This is happening at many sites on my hands and feet. I''ve never had this sensation before. I talked my healthcare provider about this in the context of a visit that was mainly addressing a different issue. She recommended Benadryl for a possible allergic reaction.

Write-up: Patient was administered their 2nd dose of Moderna from a vial that had been in the refrigerator for 31 days. Vial did not undergo any temp excursions but was technically expired since it was past day 30 of refrigeration. I called Moderna today, 7/25/21 to inquire about next

steps. Per current information available, I was informed that there is no recommendation in terms of whether or not to administer another dose, it is based on healthcare provider judgement. More than 2 doses have not been studied at this time. We will reach out to pt"s MD to get their opinion as well. Case has been sent to Moderna safety team and they will let us know if they have any additional info to provide.

CDC Split Type:
Write-up: Pregnant: approximately 37 wks 3 days Due Date: August 11th Injection given. Approximately 15-30 seconds passed. Feeling that something was wrong, lasted only a second before I felt like my breathing was changing. Felt a pressure on all sides of me, heaviness. Each breath became harder to take. Called for help. Tried to stand but could not, fell to floor. Very

difficult to get in air at all. Crawled into room with technician who went for emergency supplies. Could not breath. Technician tried to administer one epi-pen, which failed to work. Administered a second. Within 5-10 seconds breathing began to improve. I began to shake uncontrollably. Chest pain /pressure started in center of chest. Unable to move from side of sit up without breathing suffering. I was taken by emergency services to the nearest hospital to make sure breathing/oxygen levels were stable. Taken to Hospital. Contractions started after about 15-20 minutes in the ambulance. The ER ran tests/labwork. I"m unaware of what they are. Once I was deemed stable for transfer, with contractions continuing, I was was transferred to Medical Center to be monitored at Labor and Delivery for potential early labor. I was discharged that evening when labor did not progress.

Write-up: Approx 17hrs after receiving shot I started feeling a mild headache and trouble concentrating. I felt physically weaker and mild stomach ache with my eyes sensitive to light. The following morning I felt almost back to normal. The following evening 2 days after receiving shot I felt a lot of Upper back and shoulder pain. I felt like throwing up but did not. I only slept 3 hours that night and was physically soar. I ate only a can of chicken noodle soup and drank a can of ginger ale Sunday 7/25/21. I slept well last night but still feel tired and a little brain fog. I ate a good breakfast this AM and believe now three days after my second shot I will likely be almost back to normal.

Diagnostic Lab Data: Test Date: 2021; Test Name: CT scan; Result Unstructured Data: CT scan of his lungs. He was diagnosed as having Deep Vein Thrombosis (DVT); Test Date: 2021; Test Name: ultrasound; Result Unstructured Data: An ultrasound of his heart and legs. He was diagnosed as having Deep Vein Thrombosis (DVT)
CDC Split Type: USMODERNATX, INC.MOD20212
Write-up: a month and a half after receiving the vaccine, I developed blood clots in legs; I was diagnosed with DVT; it travelled to the lungs; This spontaneous case was reported by a consumer and describes the occurrence of THROMBOSIS (a month and a half after receiving the vaccine, I developed blood clots in legs), DEEP VEIN THROMBOSIS (I was diagnosed with DVT) and PULMONARY EMBOLISM (it travelled to the lungs) in a 41-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 031L20A and 026L20A) for COVID-19 vaccination. No Medical History information was reported. On 09-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 06-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. In March 2021, the patient experienced THROMBOSIS (a month and a half after receiving the vaccine, I developed blood clots in legs) (seriousness criteria hospitalization and medically significant), DEEP VEIN THROMBOSIS (I was diagnosed with DVT) (seriousness criteria hospitalization and medically significant) and PULMONARY EMBOLISM (it travelled to the lungs) (seriousness criteria hospitalization and medically significant). The patient was treated with APIXABAN (ELIQUIS) in March 2021 for Deep vein thrombosis, at a dose of UNK dosage form. At the time of the report, THROMBOSIS (a month and a half after receiving the vaccine, I developed blood clots in legs), DEEP VEIN THROMBOSIS (I was diagnosed with DVT) and PULMONARY EMBOLISM (it travelled to the lungs) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In 2021, Computerised tomogram: he was diagnosed as having deep vein thrombosis (abnormal) CT scan of his lungs. He was diagnosed as having Deep Vein Thrombosis (DVT). In 2021, Ultrasound Doppler: he was diagnosed as having deep vein thrombosis (abnormal) An ultrasound of his heart and legs. He was diagnosed as having Deep Vein Thrombosis (DVT). Patient reports having to be hospitalized overnight, one month after vaccination. He stated that he was previously a healthy male with no underlying health conditions. Concomitant medications were not provided. Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.; Sender''s Comments: Based on the current available information and temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded.

Allergies:
Diagnostic Lab Data: Test Name: Body temperature; Result Unstructured Data: Test Result:100.8; Comments: slight increase in temp (no higher than 100.8) for 24 hours
CDC Split Type: USPFIZER INC2021480864
Write-up: loose cough; chills; slight increase in temp (no higher than 100.8) for 24 hours; This is a spontaneous report from a contactable consumer, the patient. A 61-year-old non-pregnant female patient received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: ER8736) via an unspecified route of administration in the arm left on 24Apr2021 at 11:30 (at the age of 61-year-old) as a single dose for COVID-19 immunisation. Medical history included environmental allergy, sinus infection (Chronic sinus infections) and upper respiratory disorder (chronic upper respiratory issues). Concomitant medications included lisinopril (MANUFACTURER UNKNOWN), acetylsalicylic acid, caffeine (BAYER BACK & BODY PAIN) and acetylsalicylic acid (ASPRIN) from unknown dates taken for unknown indications. The patient previously took erythromycin (MANUFACTURER UNKNOWN) for unknown indication on unknown date. The patient previously took first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: ER2613) via an unspecified route of administration in the arm left on 03Apr2021 at 13:45 (at the age of 61-year-old) as a single dose for COVID-19 immunisation. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any other vaccines within four weeks prior to the COVID vaccine. On 25Apr2021 at 07:30, the patient experienced incredible chills, slight increase in temp (no higher than 100.8) for 24 hours, and a cough. It had been 5 days and the patient still had a loose cough that the patient was concerned about and the patient would like to talk to someone before making an appointment with her physician to discuss a course of treatment and need to know about medications that her physician normally prescribes for upper respiratory problems vs. vaccine ingredients. The clinical outcome of the event loose cough was not recovered at the time of this report. The clinical outcome of the event slight increase in temp (no higher than 100.8) for 24 hours and chills was unknown at the time of this report. No follow-up attempts are needed. No further information is expected.

CDC Split Type:
Write-up: Patient came to pharmacy with father to receive the first Covid vaccine from Pfizer. Father reported that the patient''s DOB at the time of service and the patient was given the vaccine as directed follow the CDC guidance. Upon billing the patient, a search was conducted to find the patient most current insurance in which her insurance rejected the claim reporting the patient''s registered DOB as on their records. When following up with the patient''s father to reconfirm the date of birth, the parents were not able to be reached and have not made a return call.

CDC Split Type:
Write-up: After the vaccine, I felt tired as I expected. Around 8:00 that night I got a very bad headache and went to bed. I woke up at 2:00am to horrid abdominal pain. It lasted about 3 hours and during that time, I could not walk or catch my breath. I figured it was a one time reaction. After that night, I had multiple times where I would double over and not be able to walk or talk. In the first week after the shot I lost 11 pounds. I continued to have daily headaches for 6 weeks after. 2 years ago my dr''s found that I had a gallstone after some imaging done of my kidneys. It had never bothered me, until hours after getting the vaccine. My doctors felt the shot brough on inflammation which triggered an underlying issue (gallstones). With a low fat diet, acupuncture and time my gallbladder attacks happened less frequently until 7/13. I had a horrid gallbladder

attack and it landed me in the Emergency Room. I have a surgical consult scheduled for 8/10 to have my gallbladder removed. I am down to 104 pounds. My joints are all very sore from my strict diet and Ehlers Danlos.

Write-up: I started having what I would describe air hunger, not SOB, I felt like did not feel right when I took breaths. There was something going wrong with my breathing. I started to have a lot of heart palpitations, I felt like my heart was having an extra beat, pounding and it would come and go for several months this was going on. I wore Z-patch a cardiac monitor. My blood pressure was elevated when I went to doctor''s office and I do not know what caused this if it was due to the air hunger symptoms. The palpitations have gone away but the air hunger thing has improved but occasionally I still have it, and I don''t feel right unless I take a deep breath. I do not have lot# to provide.

Write-up: left face cheek got tingly feeling; Left hand, left foot got tingly feeling; Very sore and throbbing arm where vaccine was/ forearm and top of hand had pain off and on all day; This is a spontaneous report from a contactable consumer, the patient. A 56-year-old non-pregnant female patient received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: ER8737) via an unspecified route of administration in the left arm on 06Apr2021 at 09:45 (at the age of 56-year-old) as a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient previously took the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number: EN6204) via an unspecified route of administration in the left arm on 16Mar2021 at 09:30 (at the age of 56-year-old) as a single dose for COVID-19 immunisation. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 06Apr2021 at 11:45, 2 hours after the vaccination, the patient left hand and left foot and left face cheek got a tingly feeling. Face tingling went away about 7 hours later. Hand and foot tingly next day. On the same day, the patient also experienced a very sore and throbbing arm where the vaccine was and the patient forearm and top of hand had pain off and on all day. The vaccine was taken on tuesday morning and by friday was pretty much gone. Just a little sore arm. Therapeutic measures were not taken as a result of the events. The events did not result in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care. The clinical outcome of the event face tingling resolved on 06Apr2021, after the duration of 7 hours. The clinical outcome of the event left hand and left foot tingly feeling was resolved on 07Apr2021. The clinical outcome of the event very sore and throbbing arm where the vaccine was/ forearm and top of hand had pain off and on all day was resolving at the time of the report. No follow-up attempts are needed. No further information is expected.

Write-up: Six weeks after the second dose I was driving on a long trip. When I got out of the car, I felt really dizzy. I was dizzy for days and it was not improved. It was intermittent during the day and came on with movement. It was like feeling fuzzy headed. Sometimes it happened during the night. I went to the Emergency room and all testing was negative. I was given some nausea medicine. I still have some Vertigo after three weeks. It is a little better because I avoid those movement that make it worse.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient reported feeling tightness/numbness in arm after injection. Upon observation, she said she also felt it in her back. Injection was correctly placed into the delt (made the "c" with my hand). I made sure she was having no numbness, she could feel me touching her. No bruising or redness. Patient did divulge that she had severe pain with first pfizer dose as well (had trouble moving arm for a few days). Followed up with patient on 8/7, she said the numbness was okay but that she was having "pain in her skin everywhere". She described it as feeling like the flu, when I pressed her she said it was not muscular but the skin itself. Injection site is also sore again, she is unable to lift arm. Reported normal adverse reactions such as malaise and fever. She said icing the injection site helps. She is alternating ibuprofen and acetaminophen but doesn''t feel it''s helping. Advised patient to continue analgesics and icing and to check in with physician if continues.

Other Medications: Actemra infusion every 4 weeks, Prolia injections every 6 mos, methotrexate 2.5mg weekly, folic acid 1mg daily, calcium carbonate 600mg twice a day, vitamin D 3000units daily, duloxetine 20mg daily, carvedilol 3.125mg twice daily, omeprazol
Current Illness: No acute illnesses
Preexisting Conditions: Rheumatoid arthritis (generalized), Hypertension, Heart failure with reduced EF, Chronic pain, osteoporosis, chronic vaginitis
Allergies: no true medications allergies, just intolerances. Aspirin caused gastric ulcer,

chlorthalidone caused hyponatremia, amlodipine caused edema, mirtazipine caused confusion
Diagnostic Lab Data: Blood work was done in the ER on 4/12/21, but no imaging, as the diagnosis was clear clinically on exam.
CDC Split Type:
Write-up: Patient received her second Moderna vaccine on 3/18/21 and then her monthly Actemra infusion for her RA on 4/1/21. The weekend after (4/3-4/4/21) her Actemra infusion (which incidently she has been doing for 3 years monthly without side effects), she developed right-sided Bell''s Palsy. When it did not improve, she went to the ER at the local hospital on 4/12/21 and the diagnosis was confirmed and she was started on Valtrex even though the symptoms had been present over 5 days. I last saw patient in follow-up on 7/23/21 and while she has had some improvement, she still cannot smile on the right or fully close her eye on the right side.

CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: flu like symptoms; lethargy; Sweats; Chills; Fever but no temperature; red, itching arm; itching arm; This spontaneous case was reported by a pharmacist (subsequently medically confirmed) and describes the occurrence of HYPERHIDROSIS (Sweats), CHILLS (Chills),

PYREXIA (Fever but no temperature), ERYTHEMA (red, itching arm) and PRURITUS (itching arm) in a 50-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 026L20A and 013L20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient''s past medical history included Cold on 15-Dec-2020. Concurrent medical conditions included CHRON''S DISEASE since 01-Jan-2000 and Crohn''s since 01-Jan-2000. Concomitant products included 6-MERCAPTOPURINE MONOHYDRATE for Crohn''s disease. On 30-Dec-2020, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 27-Jan-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 31-Dec-2020, the patient experienced PYREXIA (Fever but no temperature), ERYTHEMA (red, itching arm) and PRURITUS (itching arm). On 01-Jan-2021, the patient experienced HYPERHIDROSIS (Sweats), CHILLS (Chills) and LETHARGY (lethargy). On 27-Jan-2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced INFLUENZA LIKE ILLNESS (flu like symptoms). The patient was treated with DIPHENHYDRAMINE for Itching, at an unspecified dose and frequency. On 04-Jan-2021, ERYTHEMA (red, itching arm) and PRURITUS (itching arm) had resolved. On 07-Jan-2021, HYPERHIDROSIS (Sweats), CHILLS (Chills) and LETHARGY (lethargy) had resolved. On 27-Jan-2021, INFLUENZA LIKE ILLNESS (flu like symptoms) had resolved. At the time of the report, PYREXIA (Fever but no temperature) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Most recent FOLLOW-UP information incorporated above includes: On 24-Mar-2021: the follow up was received at 24-3-21 in general tab the reporter address and fax number was updated, patients height weight race and patient''s current history Crohn''s disease, historical condition lingering cold symptoms was updated. the Concomitant medicine 6-MERCAPTOPURINE was updated, in events outcome was updated from unknown to recovered and resolved,events like severe redness and itching at site of injection and alternating severe sweats and chills and lethargy this events was recovered and resolved On 07-Apr-2021: No specific follow-up information recorded.; Sender''s Comments: Based on the current available information and temporal association between the use of the product and the start date of these events, a causal relationship cannot be excluded.

Write-up: vaccines / been exposed to temperatures in the 50s Farenheit degrees / up to 30 patients could have received vaccines exposed to that temperature excursion; This case was reported by a nurse via call center representative and described the occurrence of incorrect storage of drug in an unknown number of patients who received HAV (Havrix) for prophylaxis. Co-suspect products included HBV (Engerix B) for prophylaxis and DTPa (Reduced antigen) (Boostrix) for prophylaxis. On an unknown date, the patient received Havrix, Engerix B and Boostrix. On an unknown date, unknown after receiving Havrix, Engerix B and Boostrix, the patient experienced incorrect storage of drug. On an unknown date, the outcome of the incorrect storage of drug was unknown. Additional details were provided as follows: The age at vaccination was not applicable for this report. A nurse practitioner reported that the system that monitored the temperature of the refrigerator that stored Havrix, Engerix-B and Boostrix had a glitch. The provider did not had data for May-June and July 2021 but suspects the vaccines might have exposed to temperatures in the 50s degree F (as reported). The nurse practitioner mentioned that an average of 08 to 10 patients were vaccinated per month in the facility and thus, her calculation was that up to 30 patients could have received vaccines exposed to that temperature excursion. No more information was available at the time of reporting. The reporter consented to follow up.

Write-up: After patient finished 15 minute observation time he did his grocery shopping. He said he was out in parking lot (90+ degrees) feeling nauseous. He sat in car and felt better then again did not feel well. His girlfriend helped him back into the store. He came to the pharmacy yellowish in palor. I asked if he was ok then while I came around the counter he began to pass out. He fell back a customer prevented him from hitting his head. I approached him and checked his status. He opened his eyes and was breathing ok. He said he needed an Epi-Pen. I asked a customer to call 911, my tech stayed with him while a retrieved the Epi-Pens. When I returned he was still resting comfortably, realizing he breathing was regular and there were no signs of anaphylactic reactions, i did not give the EPI-Pen. He stayed laying flat describing how he felt, breathing well but feeling light headed. The First responder arrived and took over. After reviewing his vitals they opted to take him to the hospital.

Write-up: received the vaccine and is currently 14 weeks pregnant; A spontaneous report was received from a 34 year old, female patient who received Moderna"s COVID-19 vaccine (mRNA-1273) and is currently 14 weeks pregnant. As provided by the reporter, the patient had no history of allergies to medications or food, and no history of alcohol, nicotine or marijuana intake. The patient had no family history of congenital anomalies/genetic disease. The patient had no previous pregnancy history. Concomitant medications taken during pregnancy included prenatal vitamins minerals nos, vitamins nos and acetylsalicylic acid. The expected due date was estimated as 27 Jun 2021. On 28 Dec 2020, at 10:12 am, the patient received their first of two planned doses of mRNA-1273 intramuscularly (lot :026L20A) in her right arm for prophylaxis of COVID-19 infection while currently 14 weeks pregnant. The patient reported no side effects to vaccine. Action taken with mRNA-1273 vaccine was unknown. The outcome of the event of vaccine exposure during pregnancy was considered unknown; Reporter"s Comments: This is a case of vaccine exposure during pregnancy with no associated AEs for this 34 year old female who is 14 weeks pregnant. Patient will continue to be contacted for further monitoring of AEs during the pregnancy

Write-up: flushing; throat swelling; tight chest; blood pressure increased; Pain in arm; This spontaneous case was reported by a pharmacist and describes the occurrence of FLUSHING (flushing), PHARYNGEAL SWELLING (throat swelling), CHEST DISCOMFORT (tight chest), BLOOD PRESSURE INCREASED (blood pressure increased) and PAIN IN EXTREMITY (Pain in arm) in a 58-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for

COVID-19 vaccination. Concurrent medical conditions included Drug allergy (morphine), Fragrance sensitivity, Allergy to chemicals (generally sensitive skin to dyes), Soap allergy and Allergy to plants (hay). On 28-Dec-2020, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 28-Dec-2020, the patient experienced FLUSHING (flushing), PHARYNGEAL SWELLING (throat swelling), CHEST DISCOMFORT (tight chest), BLOOD PRESSURE INCREASED (blood pressure increased) and PAIN IN EXTREMITY (Pain in arm). At the time of the report, FLUSHING (flushing), PHARYNGEAL SWELLING (throat swelling), CHEST DISCOMFORT (tight chest), BLOOD PRESSURE INCREASED (blood pressure increased) and PAIN IN EXTREMITY (Pain in arm) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. No treatment medication were provided. No concomitant medication were provided.

CDC Split Type:
Write-up: I notice this ONLY upon waking, while still lying in bed. NOT every day, but has happened anywhere from 1 to 5 days out of 7 since first occurrence. Upon breathing deeply through the nose, at the end of the breath, I feel a sensation (mild pain) behind my left breast, seemingly in lung or near heart. On each breath. Occasionally, when I have turned on my left side (during this same waking time), I have had a more widespread pain along the side of my body next to my left breast. This is not being felt IN my breast, but behind or beside.

Allergies:
Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: extreme fatigue; chills; nausea; soreness at the injection site; This spontaneous case was reported by a patient and describes the occurrence of CHILLS (chills), NAUSEA (nausea), VACCINATION SITE PAIN (soreness at the injection site) and FATIGUE (extreme fatigue) in a 53-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. Unknown) for COVID-19 vaccination. The patient''s past medical history included No adverse event (no reported medical history). On 24-Jan-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine)

(unknown route) 1 dosage form. On 24-Jan-2021, the patient experienced CHILLS (chills), NAUSEA (nausea) and VACCINATION SITE PAIN (soreness at the injection site). On 25-Jan-2021, the patient experienced FATIGUE (extreme fatigue). On 26-Jan-2021, CHILLS (chills), NAUSEA (nausea), VACCINATION SITE PAIN (soreness at the injection site) and FATIGUE (extreme fatigue) had resolved. Action taken with mRNA-1273 in response to the event was not applicable. Treatment information was not provided. No relevant concomitant medications were reported.; Sender"s Comments: Based on the current available information and temporal association between the use of mRNA-1273 and the onset of the events, a causal relationship cannot be excluded. Chills, vaccination site induration, vaccination site pain, nausea, and fatigue are consistent with the product safety profile

Write-up: Exactly a week after receiving the first dose of the Moderna vaccine I had hives on the injection site and my throat swelled and was itchy and my tongue also swelled and was itchy to the point that it scalloped and I had trouble with breathing and being light headed for a few days. I was worried about getting the second shot, but the pharmacist just brushed off my symptoms and concerns and injected the opposite arm. I immediately had a huge hive on the injection site and the itchy throat and tongue came back worse. It has been over a month and the itchy throat and tongue have not subsided. No allergy meds are helping.

Diagnostic Lab Data: Blood and urine samples were collected on Saturday Feb 13th which indicated inflammation, and blood/protein in urine. GFR was at 56 and creatine was up to 1.06 from past baseline on .8. I was also tested for covid which was negative. Followed up with Primary Care Feb 18th for more tests and ongoing follow up until Kidney function returned to normal approximately 2 months later.
CDC Split Type:
Write-up: Approximately 24 hours after my second vaccination on Feb 11 2021 my husband noticed my urine was dark brown/red in color. I had severe fatigue, severe hip/joint pain, flank pain, chills and flu like symptoms. I started to feel better from chills/flu like symptoms Saturday Feb 13, however, still had significant pain in my hips, flank pain, and clear indication of blood in my urine. I call my medical provider and was advised to go to Emergency Department Saturday evening. Blood work and urine was collected and after reviewing labs the Emergency department concluded that I had an arthritic inflammatory response and neuritis. I was sent home , told to drink lots of water and monitor symptoms. after about 10 days in bed and hydrating I was able to

return to work/normal functioning.

Write-up: Severe migraines; Hot and cold; Fell asleep on the phone; Her whole body went numb; Zombie kind of feeling; Diarrhea; Dry mouth; It feels like the flu; Wanting to throw up; Chills; This spontaneous case was reported by a consumer and describes the occurrence of MIGRAINE (Severe migraines), FEELING OF BODY TEMPERATURE CHANGE (Hot and cold), SLEEP DISORDER (Fell asleep on the phone), HYPOAESTHESIA (Her whole body went numb) and FEELING ABNORMAL (Zombie kind of feeling) in a 59-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient''s past medical history included Thyroid cancer in 2017. On 28-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 28-Jan-2021, the patient experienced MIGRAINE (Severe migraines), FEELING OF BODY TEMPERATURE CHANGE (Hot and cold),

SLEEP DISORDER (Fell asleep on the phone), HYPOAESTHESIA (Her whole body went numb), FEELING ABNORMAL (Zombie kind of feeling), DIARRHOEA (Diarrhea), DRY MOUTH (Dry mouth), INFLUENZA LIKE ILLNESS (It feels like the flu), NAUSEA (Wanting to throw up) and CHILLS (Chills). The patient was treated with PARACETAMOL (TYLENOL) at an unspecified dose and frequency and IBUPROFEN at an unspecified dose and frequency. At the time of the report, MIGRAINE (Severe migraines), FEELING OF BODY TEMPERATURE CHANGE (Hot and cold), SLEEP DISORDER (Fell asleep on the phone), HYPOAESTHESIA (Her whole body went numb), FEELING ABNORMAL (Zombie kind of feeling), DIARRHOEA (Diarrhea), DRY MOUTH (Dry mouth), INFLUENZA LIKE ILLNESS (It feels like the flu), NAUSEA (Wanting to throw up) and CHILLS (Chills) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Concomitant medications used are Cancer medication.

CDC Split Type:
Write-up: None after 1st shot. After 2nd: Felt crummy all next day. Then that went away and felt

ok again. Didn''t eat but did drink fluids that day. No Alcohol or drugs or tobacco. The next day I woke up with severe muscle aches in hamstrings, shoulders, arms, back. This stayed until Saturday that week. Was very discouraged, fatigued and immobile. I was going to call for appt on Monday. I remembered I had 7 days worth of a Prednisone perscription that I hadn''t needed to take in the fall of 2020. So I took 2- 20mg pills once a day for 7 days. After just a few hours of the first dose, I felt somewhat better and that continued quickly relieving the pain and stiffness and fatigue.

Write-up: Armpit hurts; hot flashes; Her whole body was shaking; massive migraine; felt tired, tired all daynext day; Headache; Her arm hurt; This spontaneous case was reported by a consumer and describes the occurrence of PAIN IN EXTREMITY (Her arm hurt), AXILLARY PAIN (Armpit hurts), HOT FLUSH (hot flashes), TREMOR (Her whole body was shaking) and MIGRAINE (massive migraine) in a 43-year-old female patient who received mRNA-1273

(Moderna COVID-19 Vaccine) (batch no. 019B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Blood pressure management, Fibromyalgia, Diabetes, Acid reflux (oesophageal) and Allergy NOS. On 05-Apr-2021, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 05-Apr-2021, the patient experienced PAIN IN EXTREMITY (Her arm hurt), FATIGUE (felt tired, tired all daynext day) and HEADACHE (Headache). On 06-Apr-2021, the patient experienced HOT FLUSH (hot flashes), TREMOR (Her whole body was shaking) and MIGRAINE (massive migraine). On 07-Apr-2021, the patient experienced AXILLARY PAIN (Armpit hurts). At the time of the report, PAIN IN EXTREMITY (Her arm hurt) and AXILLARY PAIN (Armpit hurts) had not resolved and HOT FLUSH (hot flashes), TREMOR (Her whole body was shaking), MIGRAINE (massive migraine), FATIGUE (felt tired, tired all daynext day) and HEADACHE (Headache) outcome was unknown. Not Provided The patient reported that her arm hurts more than first dose. On 06-Apr-2021, she was tired all day. The patient received unspecified medication for migraine. This case was linked to MOD-2021-069627 (Patient Link).

Current Illness: Postural orthostatic tachycardia syndrome; Tinnitus (Tinnitus increased with second dose, about 2 weeks after second Moderna dose)
Preexisting Conditions: Medical History/Concurrent Conditions: Suspected COVID-19 (All test negative. symptoms of lung COVID)
Allergies:
Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: Red veins in eye whites predominant; 2 types of mild hearing loss/ now some hearing loss; Tinnitus; redness/ flush, like redness, on her body/redness on her face/chest and neck and legs were all red; like I had sunburn all over my body; flush/ the flush appeared on my face & body-chest, neck, everywhere when pressed lightens; Migraine; tachycardia/ high heart rate; This spontaneous case was reported by a consumer and describes the occurrence of TINNITUS (Tinnitus), ERYTHEMA (redness/ flush, like redness, on her body/redness on her face/chest and neck and legs were all red), SUNBURN (like I had sunburn all over my body), FLUSHING (flush/ the flush appeared on my face & body-chest, neck, everywhere when pressed lightens) and MIGRAINE (Migraine) in a 48-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 016M2DA and 013L20A) for COVID-19 vaccination. The

occurrence of additional non-serious events is detailed below. The patient''s past medical history included Suspected COVID-19 (All test negative. symptoms of lung COVID) on 15-Mar-2020. Concurrent medical conditions included Postural orthostatic tachycardia syndrome since 2020 and Tinnitus (Tinnitus increased with second dose, about 2 weeks after second Moderna dose) since March 2021. Concomitant products included MAGNESIUM, COLECALCIFEROL (D3), ZINC, VITAMIN C [ASCORBIC ACID] and ACETYLCYSTEINE (NAC [ACETYLCYSTEINE]) for an unknown indication. On 21-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 17-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosage was changed to 1 dosage form. On 17-Feb-2021, the patient experienced ERYTHEMA (redness/ flush, like redness, on her body/redness on her face/chest and neck and legs were all red), FLUSHING (flush/ the flush appeared on my face & body-chest, neck, everywhere when pressed lightens), MIGRAINE (Migraine) and TACHYCARDIA (tachycardia/ high heart rate). 17-Feb-2021, the patient experienced SUNBURN (like I had sunburn all over my body). On 03-Mar-2021, the patient experienced TINNITUS (Tinnitus). On an unknown date, the patient experienced OCULAR HYPERAEMIA (Red veins in eye whites predominant) and HYPOACUSIS (2 types of mild hearing loss/ now some hearing loss). On 18-Feb-2021, TACHYCARDIA (tachycardia/ high heart rate) had resolved. At the time of the report, TINNITUS (Tinnitus) had not resolved, ERYTHEMA (redness/ flush, like redness, on her body/redness on her face/chest and neck and legs were all red), SUNBURN (like I had sunburn all over my body) and FLUSHING (flush/ the flush appeared on my face & body-chest, neck, everywhere when pressed lightens) was resolving, MIGRAINE (Migraine) had resolved and OCULAR HYPERAEMIA (Red veins in eye whites predominant) and HYPOACUSIS (2 types of mild hearing loss/ now some hearing loss) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. The patient reported that she stopped all supplements except vitamin D3, but there was no change in flushing and redness. There was some minimal flushing She consulted with an audiologist on an unspecified date, and was told that the mild hearing loss could have been due to inflammation from vaccine and may require surgery. She has a follow up with ENT (ear, nose, throat) doctor on an unspecified date. No treatment information was not provided. This case was linked to MOD-2021-089491 (E2B Linked Report). Most recent FOLLOW-UP information incorporated above includes: On 28-May-2021: Added patient''s demographics, physician correspondence, medical history, concomitant medications, events(migraine, ocular hyperemia, hypoacusis and tachycardia). Events outcome updated.; Sender''s Comments: MOD-2021-089491:

Write-up: Redness; No appetite/lack of appetite leading them; Rash on the stomach; Vaccination site pain; This spontaneous case was reported by a consumer and describes the occurrence of VACCINATION SITE PAIN (Vaccination site pain), ERYTHEMA (Redness), DECREASED APPETITE (No appetite/lack of appetite leading them) and RASH (Rash on the stomach) in a 63-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 025C2IA) for COVID-19 vaccination. Concurrent medical conditions included Diabetes and Cancer. Concomitant products included VERAPAMIL HYDROCHLORIDE (VERPAMIL), METFORMIN, VITAMIN D NOS, LETROZOLE and SPIRONOLACTONE for an unknown indication. On 10-May-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 11-May-2021, the patient experienced VACCINATION SITE PAIN (Vaccination site pain), DECREASED APPETITE (No appetite/lack of appetite leading them) and RASH (Rash on the stomach). On 12-May-2021, the patient experienced ERYTHEMA (Redness). On 12-May-2021, RASH (Rash on the stomach) had resolved. At the time of the report, VACCINATION SITE PAIN (Vaccination site pain) and DECREASED APPETITE (No appetite/lack of appetite leading them) outcome was unknown and ERYTHEMA (Redness) had not resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. Most recent FOLLOW-UP information incorporated above includes: On 11-Jun-2021: Follow-up included a TCR with no new significant information

Write-up: felt flu like symptoms; under the shoulder "not swollen but puffy"; puffy rash on shoulder; itchiness of arm; hives on arm; redness about 5 inches long up and down arm around site of injection; tenderness of injection site; This spontaneous case was reported by a consumer and describes the occurrence of INFLUENZA LIKE ILLNESS (felt flu like symptoms), SKIN SWELLING (under the shoulder "not swollen but puffy"), RASH (puffy rash on shoulder), VACCINATION SITE PRURITUS (itchiness of arm) and VACCINATION SITE URTICARIA (hives on arm) in an 87-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 014C21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 01-May-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 12-May-2021, the patient experienced SKIN SWELLING (under the shoulder "not swollen but puffy"), RASH (puffy rash on shoulder), VACCINATION SITE PRURITUS (itchiness of arm), VACCINATION SITE URTICARIA (hives on arm), VACCINATION SITE ERYTHEMA (redness about 5 inches long up and down arm around site of injection) and VACCINATION SITE PAIN (tenderness of injection site). On 14-May-2021, the patient experienced INFLUENZA LIKE ILLNESS (felt flu like symptoms). The patient was treated with PARACETAMOL (TYLENOL) at an unspecified dose and frequency. At the time of the report, INFLUENZA LIKE ILLNESS (felt flu like symptoms), SKIN SWELLING (under the shoulder "not swollen but puffy"), RASH (puffy rash on shoulder), VACCINATION SITE PRURITUS (itchiness of arm), VACCINATION SITE URTICARIA (hives on arm), VACCINATION SITE ERYTHEMA (redness about 5 inches long up and down arm around site of injection) and VACCINATION SITE PAIN (tenderness of injection site) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. The 2nd dose scheduled on 26-May-2021. Tylenol used as treatment. No concomitant products reported. Most recent FOLLOW-UP information incorporated above includes: On 01-Jul-2021: Updated patient demographics, no other new information was received.

CDC Split Type:
Write-up: On the night of day 6, I suddenly had incredible pain in my arm at the site of the vaccination, moving up into my shoulder and neck on the same side. It subsided quickly, but then returned as I was sleeping. I could not lie on my opposite side either. It passed by the next morning. Pain returned again on day 13, but this time the pain was agonizing, lasted two days, and seemed to be causing my right shoulder to spasm regularly. Ice, Advil or Tylenol weren''t helpful. On day 28 the pain returned, my subscapular muscle spasm made my shoulder move, my heart rate went up, my blood pressure went WAY down, then became normal. My D.O. said as it wasn''t SIRVA, or another type of injury, it was likely connected to the vaccine and that it might be helpful for researchers if I reported it here. Incidental to this very challenging experience, in the weeks following my vaccination I also developed a strange water retention through out my body and experienced some fatigue, particularly after exertion, and sleep disruptions, and changes in bowel movement that were like symptoms I''d experienced the previous year, post a presumed case of Covid 19. These issues continued even after the shoulder/neck muscular issue resolved. Sometime in the early part of July I suddenly stopped having the water retention, bowel issues, energy issues, or sleep disruptions too. I now feel well again. Note: I am presumed to have had Covid last year, in the early to mid part of March 2020. This was before tests were available, and

before we understood that the symptoms I (and my husband) had were indicators of Covid 19. I went on to experience symptoms that later we learned were "long haul" symptoms for approximately 6 months after my illness in March, clearing in December of that year. I even had "covid toes" and developed Beau"s lines in my toenails! I think it may be possible that I had a strong reaction to the vaccine because I already had some antibodies from the previous year. I am filing this as I hope having this information is helpful to someone. I waited until now to file so that I could be sure I had no other reactions to record.

Current Illness: N/A
Preexisting Conditions: N/A prior to Pfizer shot
Allergies: N/A until after Pfizer Covid shot
Diagnostic Lab Data: See above*
CDC Split Type:
Write-up: I had the first Pfizer shot in my left arm on 3/11/21. Shortly after, I had a patch on my lower forearm that was itchy and would not heal. I had surgery on my right arm at the end of March and had my second shot on 4/2/2021 in my right arm. Around May 6, 2021, I began to have weeping around the surgical scar on my right arm from a partial elbow replacement surgery in March. It was yellow fluid. Initially I was treated for a bacterial infection and put on steroids. The weeping spread and I had a rash on my lower right arm. There was concern I might be allergic to the metal implant. It then spread fully to my left arm with the initial patch never healing. I was taken off of Lamictal to ensure that was not the cause. I went to dermatology and was put on oral and topical antibiotics and steroids. The rash continued to spread and I went for patch testing June 21-25, 2021 and was found to be allergic to linalool, bacitracin, neomycin and tobramycin (none of which I had previously been allergic to.) I was not found to be allergic to anything in the implant, as the doctors contacted Johnson and Johnson to ensure none of the above allergens were in in the implant that was used and after reviewing their notes, none of the known allergens were used deeply during my surgery. I continued to have weeping, itchy patches on my body which the dermatologist treated with topical and oral steroids. To try to control the skin outbreaks, I have been prescribed Dupixent, of which I took my first does on 8/16/2021 along with topical steroids. As of 8/24/2021 the outbreaks are continuing.

Diagnostic Lab Data: heart holster monitor
CDC Split Type: vsafe
Write-up: After the 2nd dose, I developed 5 swollen lymph nodes in my neck and collar bone and 2 in my groin (I already had 2 swollen lymph nodes with the 1st dose). It took 4 weeks to resolve. I also had pain at injection site which resolved after 3-4 days. On July 11, 2021, I woke up with an achy feeling in my chest. I started having loud and hard pounding. I had about 60-70 heart palpitations episodes. I was feeling tired, fatigue, chest heaviness, chest achiness which radiated outwards when I had episode of arrhythmia. I did go see my doctor 2 weeks later on July 28 2021. By the time I saw the doctor, the intensity had decreased. I had to wear a holster monitor which showed premature ventricular contractions and atrial contractions. I was not placed on medications since my cardiac event was not hindering my quality of life or life threatening. As of now, I am still having 10-15 episodes of arrhythmias mostly in the mornings or evenings. I do I get the discomfort/achiness/soreness in my chest when I am having an episode.

Write-up: big, itchy patches all over both of my legs; site of the injection was really hot, red, and itchy; site of the injection was really hot, red, and itchy; site of the injection was really hot, red, and itchy; Little lump; This spontaneous case was reported by a consumer (subsequently medically confirmed) and describes the occurrence of VACCINATION SITE MASS (Little lump), PRURITUS (big, itchy patches all over both of my legs), VACCINATION SITE WARMTH (site of the injection was really hot, red, and itchy), VACCINATION SITE PRURITUS (site of the injection was really hot, red, and itchy) and VACCINATION SITE ERYTHEMA (site of the injection was really hot, red, and itchy) in a 77-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 013M20A) for COVID-19 vaccination. No Medical History information was reported. On 10-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 10-Feb-2021, the patient experienced VACCINATION SITE MASS (Little lump). On 18-Feb-2021, the patient experienced VACCINATION SITE WARMTH (site of the injection was really hot, red, and itchy), VACCINATION SITE PRURITUS (site of the injection was really hot, red, and itchy) and VACCINATION SITE ERYTHEMA (site of the injection was really hot, red, and itchy). On an unknown date, the patient experienced

PRURITUS (big, itchy patches all over both of my legs). The patient was treated with DIPHENHYDRAMINE HYDROCHLORIDE (BENADRYL [DIPHENHYDRAMINE HYDROCHLORIDE]) on 22-Feb-2021 at an unspecified dose and frequency. At the time of the report, VACCINATION SITE MASS (Little lump), VACCINATION SITE WARMTH (site of the injection was really hot, red, and itchy), VACCINATION SITE PRURITUS (site of the injection was really hot, red, and itchy) and VACCINATION SITE ERYTHEMA (site of the injection was really hot, red, and itchy) outcome was unknown and PRURITUS (big, itchy patches all over both of my legs) had not resolved. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. No concomitant medications were reported. This case was linked to MOD-2021-096058 (Patient Link). Most recent FOLLOW-UP information incorporated above includes: On 27-Apr-2021: The event pruritis outcome was changed from unknown to not recovered.

Other Medications: Atorvastatin, Lisinopril/HCTZ, Meloxicam, Omelprazole, Krill oil, Multivitamin
Current Illness: arthritis, GERD
Preexisting Conditions: Arthritis
Allergies: none
Diagnostic Lab Data: Described above. Also blood tests and x-rays.
CDC Split Type:
Write-up: I developed what was thought to be pneumonia which was treated with an antibiotic and improved. About 10 days later I developed swelling in my right foot and calf. A blood clot was suspected and I was sent to the hospital for and ultrasound which confirmed that I had a massive blood clot in my right leg from my groin to my ankle. I was advised to go to the emergency room, was admitted to the hospital,and a CAT scan taken of my lungs which showed that both of them had emboli. I was placed on a heparin drip for two days and now take blood thinner medication.

Write-up: arm developed instant temporary bruising on the bicep, forearm and pad of palm on her right arm! Not the arm she got the shot in. 5 minutes after he shot her arm turned blue and purple, like widespread bruising. No one had seen that happen before. and like 4 hours after the shot the discoloration completely went away. Never discomfort, swelling or fevers ar any other side effects, just crazy bruising all down her right arm. I yelled "she"s turning blue!" it was scary! But she was totally fine after.

The occurrence of additional non-serious events is detailed below. The patient''s past medical history included Passed out, Feeling sick and Infusion (Infusion for osteoporosis). Concurrent medical conditions included Contrast media allergy, Lactose intolerant, Osteoporosis and Thyroid disorder. Concomitant products included VITAMINS NOS for an unknown indication. On 13-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 10-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 10-Apr-2021, the patient experienced DELIRIUM (Delirium) (seriousness criterion medically significant), DIARRHOEA (Diarrhea), DIZZINESS (Dizziness), DEHYDRATION (Dehydration), HYPERHIDROSIS (Sweating when fever broke), DECREASED APPETITE (Loss of Appetite), PANIC ATTACK (Panic/Same panic and anxiety), ANXIETY (Anxiety/Same panic and anxiety), SWELLING (Even worse swelling), PAIN (More pain), ERYTHEMA (More redness), VACCINATION SITE INDURATION (Hardness at injection site), PYREXIA (Fever (mostly 102F to 103.6F)/High fever), FATIGUE (Fatigue to the degree of immobile/Much worse fatigue), NAUSEA (Nausea), VOMITING (Vomiting), MYALGIA (Muscle pain throughout body) and ARTHRALGIA (Joint pain in entire arm, hand, elbow, shoulder, ribs, hip and neck on side of injection). In April 2021, the patient experienced PANIC REACTION (Panic), ANXIETY (Anxiety), FEELING ABNORMAL (Experience was terrifying/3 days of the same general body symptoms) and FATIGUE (Fatigue). On 14-Apr-2021, DELIRIUM (Delirium), DIARRHOEA (Diarrhea), DIZZINESS (Dizziness), DEHYDRATION (Dehydration), DECREASED APPETITE (Loss of Appetite), PANIC ATTACK (Panic/Same panic and anxiety), ANXIETY (Anxiety/Same panic and anxiety), SWELLING (Even worse swelling), PAIN (More pain), ERYTHEMA (More redness), VACCINATION SITE INDURATION (Hardness at injection site), FATIGUE (Fatigue to the degree of immobile/Much worse fatigue), NAUSEA (Nausea), VOMITING (Vomiting), MYALGIA (Muscle pain throughout body) and ARTHRALGIA (Joint pain in entire arm, hand, elbow, shoulder, ribs, hip and neck on side of injection) had

resolved. In April 2021, HYPERHIDROSIS (Sweating when fever broke), PANIC REACTION (Panic), ANXIETY (Anxiety), FEELING ABNORMAL (Experience was terrifying/3 days of the same general body symptoms), PYREXIA (Fever (mostly 102F to 103.6F)/High fever) and FATIGUE (Fatigue) had resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On an unknown date, Body temperature: 102 to 103.6 (High) Mostly 102F to 103.6F. On an unknown date, SARS-CoV-2 test: negative (Negative) Negative. On 10-Apr-2021, the patient received second dose of Moderna vaccine and has side effects as: even worse swelling, more pain, more redness, more hardness at injection site. Fever for 54 hours, mostly 102F to 103.6F, fatigue to the degree of immobile, nausea, diarrhea, vomiting, delirium, dizziness, dehydration, muscle pain throughout body, joint pain in entire arm, hand, elbow, shoulder, ribs, hip and neck on side of injection, severe sweating when fever broke for 8 hours, loss of appetite, severe panic, and severe anxiety. Duration 4 days. Two weeks later: the patient had 3 days of the same general body symptoms, including the high fever, much worse fatigue, plus the same panic and anxiety and state that all of this experience was absolutely terrifying. Patient had all COVID-19 PCR tests before, during, and after these weeks: all negative. Patient experienced severe reactions to other vaccines in past: flu vaccine, yellow fever etc. Patient did not go anaphylactic, but does experience severe swelling. On one opportunity, as a child, received a vaccine and had swelling being so strong, that patient passed out. Patient was concerned to have a third dose in the future in part because local clinical does not have so much information on what to do. Concomitant medication included Tyrod medication and a couple of Vitamins. Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. This case was linked to MOD-2021-284720 (Patient Link).; Sender''s Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded.

Allergies:
Diagnostic Lab Data: Test Date: 202102; Test Name: CT scan; Result Unstructured Data: Normal; Test Date: 202102; Test Name: MRI; Result Unstructured Data: Normal.
CDC Split Type: USMODERNATX, INC.MOD20212
Write-up: vertigo/ extreme episode of vertigo; lightheadedness; This spontaneous case was reported by a consumer and describes the occurrence of VERTIGO (vertigo/ extreme episode of vertigo) and DIZZINESS (lightheadedness) in an 88-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 631M20A and 026A21A) for COVID-19 vaccination. No medial history was reported. Concomitant products included METOPROLOL, MULTIVITAMIN [VITAMINS NOS], ESCITALOPRAM OXALATE (LEXAPRO), APIXABAN (ELIQUIS) and GLUCOSAMINE for an unknown indication. On 17-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 17-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 22-Feb-2021, the patient experienced VERTIGO (vertigo/ extreme episode of vertigo) (seriousness criterion hospitalization) and DIZZINESS (lightheadedness) (seriousness criterion hospitalization). The patient was treated with PROMETHAZINE HYDROCHLORIDE (METHAZINE) for Adverse event, at an unspecified dose and frequency and SCOPOLAMINE [HYOSCINE] for Adverse event, at an unspecified dose and frequency. At the time of the report, VERTIGO (vertigo/ extreme episode of vertigo) and DIZZINESS (lightheadedness) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In February 2021, Computerised tomogram: normal (normal) Normal. In February 2021, Magnetic resonance imaging: normal (normal) Normal. It was reported that the patient had seen an ear, nose, throat health care provider and test were run, everything had come back as normal. The patient was hospitalized for about 3 or 4 days. The patient had a MRI and CT scan and everything came back normal. Company comment: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested.; Sender''s Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested.

Write-up: Entire body became numb/Her legs are numb and tingly when shes walking, and her arms.; Fingertips and toes are ice cold/ her fingers are ice cold; Having a hard time moving her legs/ it feels like she is walking through water or sand on the beach; Her entire body went numb and tingly, all extremities; Shes moving in slow motion; Shes a little stressed; This is a spontaneous report from a contactable consumer (patient) via Medical Information team. A 36-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, formulation: Solution for injection, Lot Number: EW0175) dose 1 via an unspecified route of administration in left arm on 03May2021 at 09:00 (at the age of 36-year-old) as single dose for COVID-19 immunisation. Medical history was none. Concomitant medications included ongoing multivitamin gummy to have vitamins. No prior vaccinations within 4 weeks. No events following prior vaccinations. She received the first dose this morning at 9 am on 03May2021. She waited at the vaccination site for 15 minutes and she felt fine. About 20 minutes after as she walked to her car her entire body became numb and her fingertips and toes were ice cold and she was having a hard time moving her legs. It felt like she was walking through water or sand on the beach. This has persisted since leaving the vaccination site. She would also like to know if she should receive the second dose due to her reaction. She does not have a doctor or health insurance so she feels like she is being left alone to deal with her reaction. She was trying to follow directions in getting vaccinated. She was calling to make sure some side effects are normal. About 15 minutes ago, her entire body went numb and tingly, all her extremities. It was like she was moving in slow motion, little stressed, she needs to make sure its normal or if she needs to go to the doctor. Her

legs were numb and tingly when she was walking, and her arms. Her fingers are ice cold. All of her symptoms are on-going and persisting. She would like to know if she should go to a doctor for her reaction the Pfizer COVID vaccine. A visit to emergency room or physician office was not required. The outcome of events was not recovered. No follow-up attempts are needed. No further information is expected.

Write-up: severe dizziness; nausea; Blood pressure was unusually high during this period; Dehydrated; This is a spontaneous report from a contactable consumer, the patient. A 60-year-old male patient received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: ER8737) via an unspecified route of administration in the arm right on 06Apr2021 at 16:00(at the age of 60-year-old) as a single dose for COVID-19 immunisation. Medical history included Stage 3 kidney failure, obesity, idiopathic (likely gluten) peripheral neuropathy, and Raynaud''s syndrome. Concomitant medications included pregabalin (LYRICA), losartan (MANUFACTURER UNKNOWN) and paracetamol (TYLENOL); all from unknown date for

unspecified indication. The past drug history was reported that patient had many drugs reaction. The patient previously received first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6198) via an unspecified route of administration in the arm right on 16Mar2021 at 14:15(at the age of 60-year-old) as a single dose for COVID-19 immunisation. Prior to the vaccination, it was unknown whether the patient was diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 08Apr2021 at 10:00 approximately 32 hours after the vaccination, the patient experienced severe dizziness and nausea and Blood pressure was unusually high during this period. On an unknown date in Apr2021 the patient experienced dehydrated. It was reported approximately 32 hours post vaccine severe dizziness and nausea, had to return to bed. Somewhat improved approx. 8 hours later, could carefully move about. Less severe but remained approximately 6 days. Did continue 3 more days before the patient realized he was dehydrated and that was likely reason it continued. The patient had a history of drug reactions to a great number of medications. The patient was very drug sensitive. Blood pressure was unusually high during this period. The patient did not bother the physician as he never felt anything more than inconvenience after the first day of onset. The adverse events did not result in a visit to the doctor or other healthcare professional office/clinic visit, and emergency room/department or urgent care. The patient did not receive any treatment for the events. The clinical outcome of dizziness, nausea, dehydrated and blood pressure high were resolving. No follow-up attempts are needed. No further information is expected.

Write-up: Swelling under left arm; fever of 100.5; chills; fatigue; This is a spontaneous report from a contactable nurse, the patient. A 65-year-old non-pregnant female patient received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number: EW0169) via an unspecified route of administration in the left arm on 01May2021 at 10:00 (at the age of 65-year-old) as a single dose for COVID-19 immunisation. Medical history included arthritis and borderline high blood pressure. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included methotrexate (MANUFACTURER UNKNOWN) for unknown indication on unknown date and unknown if ongoing. The patient had no known allergies. The patient previously received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number: ER2613) via an unspecified route of administration in the left arm on 03Apr2021 at 16:15 (at the age of 65-year-old) as a single dose for COVID-19 immunisation. On 02May2021, the patient experienced swelling under left arm, fever of 100.5 (unspecified units), chills and fatigue. On 02May2021, the patient underwent lab tests and procedures which included body temperature and the fever was 100.5. The events did not result in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care. No therapeutic measures were taken as a result of the reported events. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcome of events swelling under left arm, fever of 100.5 (unspecified units), chills and fatigue was resolved on an unknown date in May2021. No follow-up attempts are needed. No further information is expected.

Preexisting Conditions: Obesity; Diabetes (type 2) but it''s well controlled - wasn''t then taking anything particular for it; fatty liver; arthritis; acid reflux (GERD); Essential Tremor - form of palsy; Hypertension well controlled
Allergies: Levaquin; Hay fever
Diagnostic Lab Data: No PCR test April 19th, 2021 negative result before the exposure. I didn''t have one after I got COVID toes.
CDC Split Type: vsafe
Write-up: COVID/related - COVID toes - peritonitis - caused by many different causes - an immune response - it only appeared on my toes. On my left foot first with a rash and prominent blood vessels appearing purple. It then went to my right foot which my big toe and my next three toes next to it turned glowing bright red and swelled up and hurt a lot. And it was itching. And then that eventually turned purple. I immediately started searching what it might be. I contacted Medical Clinic and told me doctor and they said I did not need to come in unless it got worse. I talked to Dr. during the course of it all. I talked to a Dermatologist on June 15. She confirmed the diagnosis. And told me to keep using the cream. OTC - Hydrocortisone cream - 1% and that took away the itching as I kept using it. It was generic brand. The initial pain receded after a a couple or three days. The discomfort (from the swelling) and the itching lasted a long time. My time for ultimate resolution was 62 days that it took. Over production of Interferon 1 and Adam 17 - that is what they are saying that causes it. I had no COVID positive test. I had a negative PCR test (April 19th, 2021). I only had the "COVID toes" and no other symptoms. Note: Exposed to a virus on May 12th. I was sitting in place was coughing and sneezing and refusing to wear a mask.

CDC Split Type:
Write-up: On 08/30/2021, at approximately at 1630, a 43-year-old non-immunocompromised male entered the Covid-19 vaccination clinic. Patient had scheduled an appointment to receive the Covid-19 Pfizer vaccine. Once he arrived at the clinic he went to check in and stated he was "here for his second Pfizer shot". Check-in personnel interpreted this as he had previously received a Pfizer shot as part of the normal two-shot Covid-19 vaccination series and was there for the second vaccination. He then filled out and read over the Pre-vaccination checklist, Emergency Use Authorization sheet, Covid-19 Vaccine Patient Information sheet, V-Safe After Vaccination Health Check sheet and Pfizer Vaccine Information Fact Sheet. Once finished filling out and reading over the vaccination paperwork, he was seated at vaccine station where employee signed off on the completed paperwork and entered patient''s number into the database and confirmed information listed. (Note that no previous vaccination had been documented into the database) employee then administered the Pfizer vaccine to patient. Once administered, patient removed his vaccination card from his pocket to which employee noticed that he had previously received one (1) dose of the Janssen Covid-19 vaccine; not the Pfizer Covid-19 vaccine. Employee wrote the vaccination lot number (EWO180) and expiration (08/2021) of the Pfizer dose given onto patient''s vaccination card, and then reported to clinic supervisors of the error in vaccine given. Patient then waited the recommended 15 minutes after the vaccine was administered and went to the check out station. At check out, he attempted to schedule an additional dose of the Pfizer vaccine. Patient was denied his request to do so. Senior staff educated patient on adverse reactions and

potential side effects of Pfizer vaccination and that the potential side effects are listed on the informational sheets. Patient was informed to contact his primary care provider or go to his local emergency department if he experienced any adverse reactions and/or side effects. The patient acknowledged the information provided by Senior Staff. Patient then questioned "so if I had went to a different clinic without my vaccine card I could get an additional dose?" Senior staff and check-out personnel explained why there was no need to do so as he was considered fully vaccinated at this time. Patient left the clinic. Upper management were informed about the situation. Patient''s pertinent information including name, DOB, and address were acquired and documented appropriately. Summary: Pt received Pfizer vaccine after previous Janssen dose. NO ADVERSE REACTION REPORTED

Diagnostic Lab Data: Test Name: Varicella serologies; Test Result: Negative
CDC Split Type: US0095075132108USA006604
Write-up: Disseminated VZV; Patient is quite ill; This spontaneous report was received from a physician, and refers to a 33 year old male patient. The patient''s concurrent conditions included seronegative inflammatory arthritis, and his concomitant medications included methotrexate, etanercept (ENBREL), and prednisone (all given for the concurrent condition). The patient had no prior history of primary varicella. On an unknown date (reported as one month prior), the patient was vaccinated with varicella virus vaccine live (oka/merck) (VARIVAX) for prophylaxis (dose, route, anatomical location, lot #, and expiration date were not provided) as his serologies were negative for varicella. On an unknown date, the patient experienced disseminated varicella zoster virus (VZV) and was quite ill (illness). Subsequently, on an unknown date, the patient was

admitted to hospital because of the events. The outcome of the events was unknown. The reporter''s causality assessment between the events and the suspect vaccine was not provided. Upon internal review, disseminated varicella zoster virus (VZV) was determined to be a medically significant event.

Diagnostic Lab Data:
CDC Split Type: USGLAXOSMITHKLINEUS202117
Write-up: Long rash on left arm; Arm pain (at the injection site); Allergic reaction on left side; Allergic-type reaction: lip swelling; Face got really itchy; Felt like lump in her throat; Extreme fatigue; This case was reported by a consumer via call center representative and described the occurrence of injection site pain in a 18-year-old female patient who received Men B NVS (Bexsero) (batch number ABXB35AA, expiry date 30th July 2022) for prophylaxis. Co-suspect products included meningococcal B recom vaccine + aloh + omv pre-filled syringe device (Bexsero Pre-Filled Syringe Device) injection syringe for prophylaxis. Previously administered products included Covid vaccine with an associated reaction of injection site rash (received on an unknown date and experienced rash at the injection site after Covid 19 shot). Concurrent medical conditions included allergic reaction and epipen (has an allergic history/has an epi-pen). Concomitant products included galcanezumab (Emgality). On 12th August 2021, the patient received the 1st dose of Bexsero (intramuscular) and Bexsero Pre-Filled Syringe Device. On 12th August 2021, less than an hour after receiving Bexsero and Bexsero Pre-Filled Syringe Device, the patient experienced injection site pain, allergic reaction, lip swelling, pruritus facial, lump feeling in throat and fatigue. On 19th August 2021, the patient experienced rash. The patient was treated with benadryl (nos) (Benadryl Oral), dexamethasone (Dexamethasone Oral) and steroids nos (Steroid (Not Specified)). On 19th August 2021, the outcome of the allergic reaction, lip swelling, pruritus facial, lump feeling in throat and fatigue were recovered/resolved. On an unknown date, the outcome of the injection site pain and rash were not recovered/not resolved. The reporter considered the injection site pain, allergic reaction, lip swelling, pruritus facial, lump feeling in throat, fatigue and rash to be related to Bexsero and Bexsero Pre-Filled Syringe Device.

This report is made by GSK without prejudice and does not imply any admission or liability for the incident or its consequences. Additional details were provided as follows: The case was reported by the mother of the patient. The reporter is the mother. The patient is the daughter. The patient received dose 1 of Bexsero (BEXSERO SUSP 1D/O.5ML PFS X10 10 PFS/CARTON) intramuscularly in the left deltoid. The reporter stated that, the patient would not be getting dose 2, Within 30 minutes of the injection the patient experienced an allergic-type reaction, lip swelling, face got really itchy, she felt like she had a lump in her throat, extreme fatigue almost instantly, and left arm pain (at the injection site). The patient was taken to urgent care where she was given oral Benadryl and oral dexamethasone. The reporter stated that, these medications helped, none of her symptoms got worse, most of her symptoms got better (everything except the arm pain) but they did not resolve entirely. The patient was sent home with steroid tablets, two days later she was still reacting/still itchy,so she took one of the steroid tablets and that cleared it up again. As of today on 19th August 2021) all of the mentioned symptoms have fully resolved except for the arm pain. The patient has had significant arm pain (at the injection site) for the past week. Today on 19th August 2021, the patient has a rash on her left arm, the rash showed up today. The rash was not exactly where the injection was given but slightly toward the inside of her upper arm. It was a long rash, this has not resolved. The reporter consented to follow up.

Write-up: Injection site soreness; Fatigue; Mild headache; This is a spontaneous report from a non-contactable pharmacist. A 37-year-old male patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN) via an unspecified route of administration on an unknown date in Apr2021 (at the age of 37-years-old), as a single dose for COVID-19 immunisation. The patient had no medical history. The patient did not have any allergies to medications, food, or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any medications within 2 weeks of the vaccination and other vaccines within four weeks prior to the COVID vaccine. On 02Apr2021, the patient experienced injection site soreness, fatigue and mild headache. The events did not result in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care. Therapeutic measures were not taken as a result of the events. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcome of the events injection site soreness, fatigue and mild headache were resolving at the time of this report. The patient received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN) via an unspecified route of administration on 22Apr2021 (at the age of 37-years-old), as a single dose for COVID-19 immunisation. No follow-up attempts are possible; information about lot/batch number cannot be obtained. No further information is expected

Allergies:
Diagnostic Lab Data:
CDC Split Type: USGLAXOSMITHKLINEUS202119
Write-up: stiff neck; painful neck; This case was reported by a consumer via call center representative and described the occurrence of stiff neck in a 62-year-old male patient who received Herpes zoster (Shingrix) for prophylaxis. The patient''s past medical history included shingles (had outbreak 35 years ago), neck pain (during outbreak) and stiff neck (during outbreak). On 10th June 2021, the patient received the 1st dose of Shingrix (intramuscular) .5 ml. On 21st June 2021, 11 days after receiving Shingrix, the patient experienced stiff neck and neck pain. On 21st June 2021, the outcome of the stiff neck and neck pain were recovered/resolved. It was unknown if the reporter considered the stiff neck and neck pain to be related to Shingrix. Additional details were reported as follows: The case was reported by the patient. The patient received dose of Shingrix and approximately 11 days after receiving the Shingrix dose he had the same stiff and painful neck, which resolved on the same day. The patient consented to follow up with his physician.

Current Illness: HIV infection
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20212
Write-up: Patient reeived third dose; had an episode where he could not breathe / could not get air in for about 45 seconds; This spontaneous case was reported by a consumer and describes the occurrence of DYSPNOEA (had an episode where he could not breathe / could not get air in for about 45 seconds) and EXTRA DOSE ADMINISTERED (Patient reeived third dose) in a 68-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 040B21A, 047C21A and 048A21A) for COVID-19 vaccination. Concurrent medical conditions included HIV infection. Concomitant products included BICTEGRAVIR SODIUM, EMTRICITABINE, TENOFOVIR ALAFENAMIDE FUMARATE (BIKTARVY) for HIV infection, AMLODIPINE, IRBESARTAN, BIOTIN and ASPIRIN [ACETYLSALICYLIC ACID] for an unknown indication. On 16-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 14-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 16-Aug-2021, received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. In April 2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced DYSPNOEA (had an episode where he could not breathe / could not get air in for about 45 seconds). On an unknown date, the patient experienced EXTRA DOSE ADMINISTERED (Patient reeived third dose). In April 2021, DYSPNOEA (had an episode where he could not breathe / could not get air in for about 45 seconds) had resolved. At the time of the report, EXTRA DOSE ADMINISTERED (Patient reeived third dose) had resolved.

In concomitant medications, Daily vitamin was also reported. No treatment details were reported. It has been reported that, caller says it is not true - that he had no issues whatsoever with the vaccine. Agent reviewed with the caller the previous case but he stated that he didn"t report anything. Most recent FOLLOW-UP information incorporated above includes: On 02-Sep-2021: Follow-up received, updated patient comment into inarrative

Other Medications: Bupropion- daily, Fluoxetine-daily, Clonazepam - rarely(as needed)
Current Illness: None
Preexisting Conditions: None
Allergies: None
Diagnostic Lab Data: None
CDC Split Type:
Write-up: Adverse event - since receiving the vaccine monthly periods have been extremely painful with a very heavy flow and multiple large clots. Previously periods were uncomfortable but not painful, flow was normal to light and there were occasional small blood clots. Treatment - tylenol, aleeve, etc. These only dull the pain a little. Outcome - 1-2 days of period are extremely painful and it is very hard to work - laying down is the most comfortable position, sitting for an extended period of time is near impossible, the cramps are unbearable and I have to get up and move around, or lay down.

Write-up: My arm as so sore I couldn''t lift it.; My arm as so sore I couldn''t lift it.; Felt like I had rotator cuff issues; I sneezed about 200 times; Couldn''t sleep for two nights; This is a spontaneous report from a contactable consumer (patient). A 69-years-old non-pregnant female patient received BNT162b2 (Pfizer-BioNTech Covid-19 mRNA Vaccine, Solution for injection, Batch/Lot number: EH6201 and Expiration date was not reported) via an unspecified route of administration, administered in right arm on 05Mar2021 at 09:15 hours as dose 1, single (at the age of 69 years old) for Covid-19 immunisation. Patient had no medical history and had no known allergies. Patient did not receive any other vaccine in four weeks. Concomitant medication within two weeks included hydrochlorothiazide and atorvastatin (both taken for an unspecified indication, start and stop date were not reported). Patient was not diagnosed with Covid-19, prior to vaccination and had not been tested for Covid-19, post vaccination. On 05Mar2021, at 11:00 hours, patient arm was so sore as she could not lift it, felt like she had rotator cuff issues, sneezed about 200 times and stated that she was not exaggerating, and patient could not sleep for two nights. Patient received no treatment for all the events. The outcome of all the events was recovered on Mar2021. No follow-up attempts are possible. No further information is expected.

CDC Split Type:
Write-up: April 3rd... Woke up thinking I had broken my left thumb.. severe pain in my thumb. April 4th... Woke up with no range of motion and sharp pain in my left shoulder. My Physician describes as frozen shoulder. April 9th... Severe Pain creeps into my right hand, accompanied by a loss of function. April 15th... By mid April the loss of range motion and Sharp pain is also in my Right Shoulder. Again my physician describes as frozen shoulder. All 4 of these Body Parts have been limited in functionality since April on, All have short periods where they cycle through highs and lows but on no day since have any been at the Pre-april State. For Self Preservation I stopped using my hands in June as simple usage triggers worseing loss of functionality and increased pain. Shoulders have essentially been frozen without relief since early april. For Reference. Covid Vaccine injections on April 1st and April 21st. Conditions in my hands and shoulders have persisted through the current date of Sept 27th 2021 with no abatement or relief in sight.

CDC Split Type:
Write-up: Patient received booster dose of Covid-19 Pfizer vaccine. Patient was observed in exit area for 15 minutes post vaccination with no complaints. As patient was exiting vaccine clinic, patient reported feeling sweaty and sat down on bench outside. Volunteer alerted public health nurse on site and nurse assessed patient. Patient was given bottled water and granola bar. She stated she felt better after water and snack, said she felt well enough to go home. Public health nurse advised patient to follow up with primary care doctor if she has any new symptoms. Patient was able to leave with daughter who brought her to the appointment.

Diagnostic Lab Data:
CDC Split Type: USGLAXOSMITHKLINEUS2021AM
Write-up: was not able to get out to get the booster due to Covid; This case was reported by a consumer via call center representative and described the occurrence of social problem in a 61-year-old patient who received HAB (Twinrix) for prophylaxis. Co-suspect products included hepatitis A and hepatitis B vaccine pre-filled syringe device (Twinrix Pre-Filled Syringe Device) injection syringe for prophylaxis. Previously administered products included Twinrix (received rapid 3-doses in August- September 2019). Concomitant products included INFLUENZA VACCINE (SEASONAL FLU SHOT). On an unknown date, the patient received Twinrix and Twinrix Pre-Filled Syringe Device. On an unknown date, unknown after receiving Twinrix and Twinrix Pre-Filled Syringe Device, the patient experienced social problem. On an unknown date, the outcome of the social problem was unknown. This report is made by GSK without prejudice and does not imply any admission or liability for the incident or its consequences. Additional details were provided are as follows: The case was reported by patient himself/herself. The age at vaccination was not applicable for this report. The patient received rapid 4-dose course of Twinrix for Hepatitis A and B in August - September 2019 and was due for 12 month booster dose in September 2020, but due to Covid and various precaution was not able to get out to get the 12 month booster dose. The patient also received seasonal flu shot a week before reporting. The patient asked the pharmacist that if it was too late (24 months, rather than 12 months) to get the 4th and final Twinrix dose, to finish the series, and he/she did not know was there any value in getting the final booster at this point or would he/she need to went through the whole series again, the next time he/she travel. The patient stated that he/she was not planning on any International travel anytime in the foreseeable future, but if he/she finish the series now, would it offer him/her any basic protection.

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20213

Write-up: Felt very weak within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot; Distinct prolonged/protracted episodes of diarrhea for about 2 months and was still slight issue; Stomach cramps/symptoms were "getting better but started all over again" after she received the second shot; Low grade fever within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot; Chills within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot; Minor nausea/symptoms were "getting better but started all over again" after she received the second shot; This spontaneous case was reported by a physician and describes the occurrence of ASTHENIA (Felt very weak within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot), DIARRHOEA (Distinct prolonged/protracted episodes of diarrhea for about 2 months and was still slight issue), ABDOMINAL PAIN UPPER (Stomach cramps/symptoms were "getting better but started all over again" after she received the second shot), PYREXIA (Low grade fever within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot) and CHILLS (Chills within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot) in a 73-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Irritable bowel syndrome and Arthritis. Concomitant products included LOPERAMIDE for Diarrhea. On 19-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 19-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On an unknown date, the patient experienced ASTHENIA (Felt very weak within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot), DIARRHOEA (Distinct prolonged/protracted episodes of diarrhea for about 2 months and was still slight issue), ABDOMINAL PAIN UPPER (Stomach cramps/symptoms were "getting better but started all over again" after she received the second shot), PYREXIA (Low grade fever within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot), CHILLS (Chills within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot) and NAUSEA (Minor nausea/symptoms were "getting better but started all over again" after she received the second shot). At the time of the report, ASTHENIA (Felt very weak within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot), DIARRHOEA (Distinct prolonged/protracted episodes of diarrhea for about 2 months and was still slight issue), ABDOMINAL PAIN UPPER (Stomach cramps/symptoms were "getting better but started all over again" after she received the second shot), PYREXIA (Low grade fever within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot), CHILLS (Chills within 24 to 30 hours of vaccine/symptoms were "getting better but started all over again" after she received the second shot) and NAUSEA (Minor nausea/symptoms were "getting better but started all over again" after she received the second shot) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. The patient got product via intramuscular injection in deltoid. No concomitant product use was provided by the reporter. Treatment medication included the patient sought medical attention from her gastroenterologist, which caller states was "reassuring", and had since been taking a "tiny amount" of 2mg loperamide anti-diarrheal tablet when needed, which helps the symptoms. This case was linked to MOD-2021-333370 (Patient Link).

Write-up: Patient administered second dose of the Moderna COVID-19 vaccine more than 35 days after the first dose; Patient administered second dose of the Moderna COVID-19 vaccine from an expired vial; This spontaneous case was reported by a pharmacist and describes the occurrence of INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Patient administered second dose of the Moderna COVID-19 vaccine more than 35 days after the first dose) and EXPIRED PRODUCT ADMINISTERED (Patient administered second dose of the Moderna COVID-19 vaccine from an expired vial) in a 47-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 022B21A and 054C21A) for COVID-19 vaccination. Concomitant products included CLONAZEPAM, BUPROPION HYDROCHLORIDE (WELLBUTRIN) and VENLAFAXINE HYDROCHLORIDE (EFFEXOR) for an unknown indication. On 10-May-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine)

(Intramuscular) 1 dosage form. On 24-Jul-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 24-Jul-2021, the patient experienced INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Patient administered second dose of the Moderna COVID-19 vaccine more than 35 days after the first dose) and EXPIRED PRODUCT ADMINISTERED (Patient administered second dose of the Moderna COVID-19 vaccine from an expired vial). On 24-Jul-2021, INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (Patient administered second dose of the Moderna COVID-19 vaccine more than 35 days after the first dose) and EXPIRED PRODUCT ADMINISTERED (Patient administered second dose of the Moderna COVID-19 vaccine from an expired vial) had resolved. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. Pharmacist reported that they had two vials of the Moderna COVID-19 vaccine which were received and refrigerated since 23JUN2021 . The vials did not experience a temperature excursion and were stored at the appropriate refrigerated temperatures through 30 days. The pharmacist wanted to know if the vials can be used beyond 30 days of storage in a refrigerator.The pharmacist asked whether the patient will have to be given the dose again, given that the dose administered was from an expired vial. No treatment information was provided. Most recent FOLLOW-UP information incorporated above includes: On 23-Sep-2021: Follow up received contains, Mail Id and contact number updated, events outcome updated to recovered.

Write-up: blood clots; This spontaneous case was reported by a health care professional and describes the occurrence of THROMBOSIS (blood clots) in a female patient of an unknown age who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. No Medical History information was reported. On an unknown date, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On an unknown date, the patient experienced THROMBOSIS (blood clots) (seriousness criteria medically significant and life threatening). At the time of the report, THROMBOSIS (blood clots) outcome was unknown. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. patient who got their first dose back in April No concomitant medication was reported. No treatment medication use was reported. The patient did not experience any other known symptoms, and they are not sure about any treatments given. For their second dose of the vaccine now the provider gave this patient an anticoagulant to take 30 minutes prior to receiving the vaccine to try and prevent further clotting. This case concerns a female patient (Unknown age) with no relevant medical history, who experienced the unexpected event of Thrombosis. The event occurred on an unspecified date after the first dose of mRNA-1273 (Moderna Covid-19 vaccine). The rechallenge was not applicable, as the event happened after the first dose. Limited information provided precludes a complete medical and causal assessment of this case. The benefit-risk relationship of mRNA-1273 (Moderna Covid-19 vaccine) is not affected by this report.; Sender''s Comments: This case concerns a female patient (Unknown age) with no relevant medical history, who experienced the unexpected event of Thrombosis. The event occurred on an unspecified date after the first dose of mRNA-1273 (Moderna Covid-19 vaccine). The rechallenge was not applicable, as the event happened after the first dose. Limited information provided precludes a complete medical and causal assessment of this case. The benefit-risk relationship of mRNA-1273 (Moderna Covid-19 vaccine) is not affected by this report.

Write-up: it is aching into her shoulder, shoulder blade and in the front; my arm started hurting/aching at injection site,; arm sore; headache; This is a spontaneous report from a contactable consumer or other non hcp (patient). A 71-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA vaccine, Solution for injection), dose 1 via an unspecified route of administration, administered in arm left on 15Mar2021 13:15 (Batch/Lot number was not reported: Expiry date: unknown) as dose 1, single for covid-19 immunisation (at the age 71-years-old). The patient medical history and concomitant medications were not reported. The patient doesn''t have family history. No relevant tests were conducted. The patient did not receive any other vaccines within 4 weeks prior to the covid 19 vaccine. On 15Mar2021, the patient experienced headache for a day then it was gone. On 22Mar2021, the patient experienced arm sore then last night it was really painful; and today it is aching into her shoulder, shoulder blade and in the front and she also reported yesterday on 23Mar2021, her arm started hurting/aching at injection site, going up into her shoulder. Reporter said and enquired for information about this and some information says a delayed onset can happen. The outcome of the event headache was recovered; arm sore was not recovered and for the remaining events it was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Current Illness: none
Preexisting Conditions: none until this vaccine
Allergies: none
Diagnostic Lab Data: I did not see a provider. If this still continues I am considering doing this, even at this late date, as I am unhappy with my current level of activity intolerance.
CDC Split Type:
Write-up: chest discomfort and dyspnea on mild exertion, such as walking up a gentle incline, malaise, easily fatigued. This improved somewhat and slowly but was renewed after the 2nd vaccine 3 weeks later. It never got as significant as the initial symptoms but has persisted over these months, still affecting stamina and activity level. Some sense of chest pressure, dyspnea on exertion, easily fatigued, need to rest frequently are significant still. I had not seen a physician about this as it did seem to be diminishing but has leveled rather than cleared.

Write-up: About six weeks after getting the second dose of the vaccine I was experiencing dizziness. I had these symptoms for about five days and one night I fainted and also vomited for no reason. I was very nauseous and sweating. I think I had Vertigo. I felt a little better after vomiting but I was still dizzy. I was very dizzy for three days and I couldn"t even walk. I went to the ER four days later and all tests were negative. I got Meclizine and I took it for a while. I could not drive and on 06/08/2021 I saw a Physical Therapist. I was still dizzy and it improved. I could not turn my head. I got more used to feeling like that and I was more able to deal with it. I was fatigued and I saw an optometrist and was diagnosed with a Cataract. On 06/30/2021 It has been four months and I am still dizzy when I move quickly.

Write-up: Fatigue; Headache; Pain at injection site; This is a spontaneous report from a non-contactable consumer, the patient. A 56-year-old non-pregnant female patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6198) via an unspecified route of administration in the left arm on 03Mar2021 at 17:45 (at the age of 56-years-old) as a single dose for COVID-19 immunisation. Medical history included known allergy to steroids. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included paroxetine (MANUFACTURER UNKNOWN), zaleplon (MANUFACTURER UNKNOWN), vitamin d nos (MANUFACTURER UNKNOWN), withania somnifera (ASHWAGANDHA) and ibuprofen (IBUPROF); all taken for an unknown indication from an unknown date and unknown if ongoing. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 04Mar2021 the patient experienced fatigue, headache and pain at injection site. The event did not result in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care. Therapeutic measures were not taken as a result of the event. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcome of the events fatigue, headache and pain at injection site was resolving at the time of this report. No follow-up attempts are possible. No further information is expected.

Write-up: Itchy throat within hours. Still occurring 3 days post injection.; Sore left arm within hours of injection.; 3 days post injection the surrounding area of site is now itchy; 3 days post injection the surrounding area of site is now itchy with a red bumpy rash.; This is a spontaneous report from a contactable consumer, the patient. A 49-year-old male patient received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6208) via an unspecified route of administration in the left arm on 11Mar2021 at 09:30 (at the age of 49-years-old) as a single dose for COVID-19 immunisation. The patient''s medical history reported was not applicable. The patient had no known allergies. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not take any concomitant medications within 2 weeks of vaccination. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 11Mar2021 at 16:00 the patient experienced itchy throat within hours, still occurring 3 days post injection, sore left arm within hours of injection, 3 days post injection the surrounding area of site was itchy with a red bumpy rash. The events did not result in doctor or other healthcare professional office/clinic visit, and emergency room/department or urgent care. Therapeutic measures were not taken as a result of the events. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcome of the events itchy throat within hours, still occurring 3 days post injection, sore left arm within hours of injection, 3 days post injection the surrounding area of site was itchy with a red bumpy rash was not recovered at the time of this report. No follow-up attempts are needed. No further information is expected.

Write-up: Patient came to the office for flu shot and shingrix #2. I administered both vaccines, Flu in LT, shingrix in LT. When I went to enter the shingrix in the mmunization registry the patient had already had 2 shingrix vaccines. We only had record of one in our database, I had given patient Shingrix in 02/2020 and that''s all I had listed in our database. It showed in the vaccine registry that this patient also recevied a dose of shingrix in 2018 so this one I gave her today 10/19/2021 would be a third (extra) dose of shingrix vaccine.

Other Medications: only ibuprophen or acetominephen as needed
Current Illness: none
Preexisting Conditions: I had Rotator Cuff surgeries on my right shoulder in June 2020 and on my left shoulder in March 2021. I have been doing PT since. These surgeries were the result of long-standing calcific tendonitis.
Allergies: only seasonal allergies to pollens
Diagnostic Lab Data: None
CDC Split Type:
Write-up: I had already had a J&J vaccine where I live on 4/5/21 (Lot EN1808978). I was getting extremely anxious about the Delta variant and reports of the declining efficacy of the Janssen vaccine so when visiting family, I went to pharmacy to get a booster of the Moderna vaccine. I had to claim I had not been vaccinated before to be eligible to get the shot, which was uncomfortable and why I hesitated to report my reaction initially. I had the usual chills after the vaccine which were fine. But about 36-48 hours after receiving the shot, my shoulder (neck, upper left back, left shoulder) began to completely freeze up. Since I have been doing PT for rotator cuff surgery for months, I know what frozen shoulder feels like. The only pain I had was along the line of my bicep tendon from the humeral head to my elbow. It was a burning pain. But my whole shoulder was completely stiff. This was very different than the shoulder soreness at the injection site and stiffness that I felt after my shingles vaccine. In the hours after my shot, I was still doing my PT exercises which included range of motion (ROM) and strength exercises for my left shoulder. However, once this reaction started, I could barely move it in any direction even with the assistance of a pulley or my other arm. This persisted for about 5 more days before it started to subside. I was about to report it to my orthopedic surgeon when it started to subside. It still is not completely back to normal ROM. None of the information I read anywhere suggested that this might be a possible reaction. I took my sister-in-law''s Nabumetone (she has lupus) for about a week because Ibuprophen was doing nothing, and it seemed to be a severe inflammatory reaction. The only list of symptoms which accorded with mine were ones I read online related to SIRVA, but I assume that that was not the cause here because my shoulder has begun to unfreeze. (I sure hope I don''t have any permanent RTC damage.) I want to report this because it is a serious side affect in case others experience this. I don''t recall if my J&J shot was in my left arm as well and if this might have made a difference. Please feel free to call me if you have any questions.

Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC202101234405
Write-up: dry mouth; itching/ severe itching (Face-Nose); it was very uncomfortable; He''s been anxious for days to talk to someone about this; The initial safety information received was reporting only non-serious adverse drug reaction(s). Upon receipt of follow-up information on 08Oct2021, this case now contains serious adverse reaction. Information processed together. This is a spontaneous report from a contactable consumer (patient). A 70-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), dose 1 via an unspecified route of administration, administered in Arm Right on 19Mar2021 11:00 (Batch/Lot Number: EN6205) (at the age of 70 years) as DOSE 1, SINGLE, dose 2 via an unspecified route of administration in Arm on 09Apr2021 12:10 (Batch/Lot Number: EW0151) (at the age of 70 years)as DOSE 2, SINGLE for covid-19 immunisation. Medical history included blood pressure (abnormal), prostate enlargement from an unknown date and unknown if ongoing, myocardial infarction from 2002 to an unknown date (Stent inserted No heart damage), stent placement from 2002 to an unknown date, diverticulitis from 1991 (Removal of intestine 1/3 due to diverticulitis, Onset Date: 30 yrs ago), eye excision from 2011 (Onset Date: 10yrs ago), eye injury from 1991 (Onset Date: 30 yrs ago), nephrectomy from 2016 (Onset Date: 5 yrs ago), hernia repair from 2016 (Onset Date: 5 yrs ago), sleep disorder. Concomitant medications included losartan taken for blood pressure, start and stop date were not reported; clonazepam taken for sleep disorder from an unspecified start date and ongoing; acetylsalicylic acid (BABY ASPIRIN) taken for an unspecified indication from an unspecified start date and ongoing; tamsulosin hydrochloride taken for prostatic disorder, start and stop date were not reported; finasteride taken for prostatic disorder from 24Jul2021 to an unspecified stop date. Patient got the first dose of the Pfizer Biontech

COVID19 vaccine on 19Mar2021 and the second dose was on 09Apr2021. Patient experienced dry mouth and itching which lasted for quite a few months already. Patient was not sure if it was after the first or second one. Patient said his doctor already gave him lozenges and it had been two months already (as reported). Patient also reported that his arm was being injected, as soon as he got injected, his mouth got very dry, it felt like cotton was in it, it was very uncomfortable. So he has been hanging it out, he told his primary, the doctor told him to suck on lozenges, which he''s done, lemon, and went to the dry mouth shelves and bought all the medications. He stated he had temporary relief from things like hot water, baking soda and water, but he''s afraid he''s going to hurt himself. His question was, nobody seemed to understand or know anything other than do lozenges, so it leaves him questioning what he should do next. He was inquiring when it was going to stop. It was reported that it was not something that''s disabling but it''s aggravating. He stated that it''s been 3 months, he doesn''t know what to do now. He also has itching all over his body, very slight, all over, face, neck, arms, since the day he got the shot. He''s been anxious for days to talk to someone about this. He stated during the shot, for the second shot, he''s only guessing; he was not sure if it was after the first or second one. He confirmed it began in Mar2021 or Apr2021, confirms it did begin in 2021. Itching and dry mouth were ongoing and persistent. As of 08Oct2021, patient reported that severe dry mouth and severe itching (face-nose) was confirmed with onset of 19Mar2021 and was now considered as serious due to Persistent/ Significant disability/ Incapacity and medically significant. Severe dry mouth required treatment of mouth drops (Biotene), and severe itching required treatment of Infusing finasteride + Flo-max. Patient reported these for finding cure for symptoms (dry mouth + itching). These were reported as experiences patient had after taking Pfizer vaccines 1 and 2. The events all required physician office visit. The outcome of events was not recovered.

Previous Vaccinations: Flu vaccine injected into the bursa.
Other Medications: Multi vitamin, calcium
Current Illness:
Preexisting Conditions: Eight days after the 2nd dose of Pfizer Covid vaccine I developed a lump in my groin that needed surgery. After the surgery I was told the lump was a tumor on my lymph node and was diagnosed with Follicular Lymphoma. Since the covid vaccine in April of 2021 my lympnnodes in my neck, groin and armpits have been enlarged and changing. Never before the covid vaccine had my lymphnodes ever been an issue. I believe the covid vaccine is responsible for my changing lymphnodes.
Allergies: Tramadol

CDC Split Type: USPFIZER INC2021206062
Write-up: Vomiting/ threw up; Diarrhea; Sick to her stomach; This is a spontaneous report from a contactable consumer (patient) and other health care professional. An 82-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, solution for injection, Batch/Lot Number: EN6201, Expiry Date: unknown), via an unspecified route of

administration on 22Feb2021 (at the age of 82-year-old) as a single dose for covid-19 immunisation. The patient medical history included gallbladder disorder and gallbladder operation (She was going through a bout right then with gall bladder problems that was why she said she does not know if that was the cause or if it seemed like it was gall bladder. She had been dealing with the gall bladder problems for about a year or more. She was tested again and again, and they finally said she has gall stones, and she has to have her gall bladder removed. The patient concomitant medications were not reported. On 23Feb2021 at 01:00 the patient experienced vomiting/ threw up, sick to her stomach, diarrhea. The reporter stated that the patient had the shot on Monday (22Feb2021), and everything was fine until 23Feb2021 (yesterday) afternoon she was sick to her stomach really bad and then during that night at about 23:30 or 24:00 she threw up and had diarrhea and she did not know if that was something that could be related to the vaccine. It was not on the sheet; nausea is but not diarrhea or throwing up. She asked if there had been anyone else call with these same symptoms. Right then it was not worse, it was worse last night, she was just sick to her stomach, she had diarrhea once again today. The patient underwent lab tests and procedures which included investigation: gall stones on unspecified date. The clinical outcome of the events was unknown. No follow-up attempts are needed. No further information is expected.

Write-up: Vertigo; Nausea; Ear fullness; Slight tinnitus; Fatigue; Brain fog; This is a spontaneous report from a contactable consumer, the patient. A 39-year-old non-pregnant female patient received the second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EP00151) via an unspecified route of administration in the left arm on 07Apr2021 at 11:00 (at the age of 39-years-old) as a single dose for COVID-19 immunisation. The patient did not have any relevant medical history. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccine. The patient did not receive any other concomitant medications. The patient previously received erythromycin (MANUFACTURER UNKNOWN) on an unknown date and experienced drug allergy. The patient previously received the first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EN6208) via an unspecified route of administration in the left arm on 10Mar2021 at 11:00 (at the age of 38-years-old) as a single dose for COVID-19 immunisation. On 16Apr2021 at 07:45, the patient experienced sudden onset and lasting vertigo, nausea, ear fullness, slight tinnitus, brain fog and fatigue. The events resulted in doctor or other healthcare professional office/clinic visit. Since the vaccination, the patient had not been tested for COVID-19. Therapeutic measures were taken as a result of events and included treatment with physical therapy from an unknown start date. The clinical outcome of the events lasting vertigo, nausea, ear fullness, slight tinnitus, brain fog and fatigue was not recovered at the time of this report. No follow-up attempts are needed. No further information is expected.

Write-up: herpes in eye; This case was reported by a consumer via call center representative and described the occurrence of herpes ophthalmic in a 88-year-old male patient who received Herpes zoster (Shingrix) for prophylaxis. On an unknown date, the patient received the 1st dose of Shingrix (intramuscular). On 7th October 2021, less than 5 months after receiving Shingrix, the patient experienced herpes ophthalmic (serious criteria GSK medically significant). The patient was treated with valaciclovir hydrochloride (Valtrex). On an unknown date, the outcome of the herpes ophthalmic was recovering/resolving. It was unknown if the reporter considered the herpes

ophthalmic to be related to Shingrix. Additional details were provided as follows: The case was reported by the patient''s wife. The age at vaccination was not reported, but it could be 87 or 88 years. In June or July 2021, the patient received Shingrix in an unknown arm. On 7th October 2021, the patient was diagnosed by the eye doctor with early herpes in the eye (unknown eye). The eye doctor treated the early herpes with Valtrex for 2 weeks which was completed at the time of reporting. The eye doctor reported that, the patient''s eye looked good after treatment with Valtrex. The reporter did not consent to follow up. The reporter did not give permission for GlaxoSmithKline to contact healthcare professional.

Write-up: numbness in her mouth; swelling face; severe palpitations; shortness of breath; chest pains; severe redness in face and chest; This is a spontaneous report from a contactable consumer. A 41-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Solution for injection; Lot number: EW0170), via an unspecified route of administration on 22Apr2021 at around 15:00 (at the age of 41-year-old) in left arm as dose 2, single for covid-19 immunisation. Medical history and family medical history relevant to adverse events were reported as none. The report was not related to a study or programme. The patient''s concomitant medications were not reported. Historical vaccine included patent previously took first

dose of bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Solution for injection; Lot number: ER8734; Expiration dates, dosages unknown), via an unspecified route of administration, administered in left arm as dose 1, single on 01Apr2021 (at the age of 41-year-old) for covid-19 immunisation. No additional vaccines administered on same date of the Pfizer suspect. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced severe redness in the face and chest, numbness of her mouth, swelling of her face, severe palpitations, chest pains on 22Apr2021 and stated that the worst part lasted 3 days, states she was three weeks in and was still experiencing these side effects. Stated the events started within 20 minutes of receiving the vaccine. Has been to the doctor, treating with Benedryl which works. Caller stated they wanted her to go to the hospital but does not have insurance so she could not go. Stated the palpitations were still there but not as severe, they come and go. Caller stated the redness in her face and chest continued but comes and goes. Shortness of breath and chest pains were in association with the palpitations that come and go throughout the day. She went to the doctor to have an EKG done, blood pressure checked, thyroid levels checked, wanted to see if it was something else, all of her other tests came back perfectly normal, exact measurements unknown. Adverse events palpitations, severe redness of face and chest, numb mouth, swelling of face, shortness of breath and chest pains were resulted in physician office. The patient underwent lab tests and procedures which included blood pressure measurement, electrocardiogram and thyroid function test were normal exact values or readings unknown on unspecified date. At the time of this report, the outcome of the event hypoesthesia oral was recovered on 23Apr2021, for palpitations was recovering and for all other event was not resolved. No follow-up attempts are needed. No further information is expected.

CDC Split Type:
Write-up: ant to document in my medical file the significant negative reaction to the COVID booster. I had eaten breakfast before my appointment (eggs, spinach and water) Booster administered around 9 am 1ish pm lunch In the afternoon I was very tired, could easily gone to sleep for a couple of hours but was at work. Dinner around 5:30, wS feeling a little achy so I took a Tylenol Out to watch an event in town (so sedentary) Home around 11Pm. I was cold, particularly my hands and feet. When I brushed my teeth, my saliva was mucusy I could NOT get warm. I woke up after an in and out sleep to my body shaking/shivering like I?ve never felt before. I was cold. There were pulse points(wrist, behind knee, groin) that would have a sharp pain and I was feeling parched. All I could think of was blood clots. I got up and took two 81 mg baby aspirin I shivered for a couple of hours, took huge advantage of a warm torso next to me, though my shivers kept him awake too, then fell to sleep around 3:30. Awakened by various alarms and a phone call at 7:15. My hands were swollen and asleep, and I was overly warm, slightly sweating A

shower helped but my whole body is achy and tender, and swollen. I?m a little stuffy. Jeans hard to get into, boots even harder to zip up all due to swelling.

Diagnostic Lab Data:
CDC Split Type: USPFIZER INC202101472643
Write-up: immunization; severe headache in back of head; Dizziness/ Feeling of passing out; Neck pain; exhaustion; nausea; chills; This is a spontaneous report from a contactable other health care professional (patient). A 58-year-old non pregnant female patient (nurse) received third dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number was not reported), via an unspecified route of administration, administered in right arm on 27Oct2021 at 13:15 (at the age of 58 years) as dose 3 (booster), single for COVID-19 immunization. The patient medical history was not reported. The patient''s concomitant medications were not reported. The patient previously received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number was not reported), via an unspecified route of administration, administered in right arm on 18Jan2021 at 14:15 as dose 1, single and received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number was not reported), via an unspecified route of administration, administered in right arm on 28Jan2021 as dose 2, single for COVID-19 immunization. The patient had no known allergies. The patient did not receive any other vaccine in four weeks. The patient did not have COVID prior vaccination. The patient did not test for COVID post vaccination. On 27Oct2021 the patient experienced Dizziness/ Feeling of passing out, severe headache in back of head, neck pain, exhaustion, nausea, and chills. On 27Oct2021 at 13:15 patient reported booster. The events resulted in emergency room/department or urgent care. Tornadol, benadryl, ibprophen, fluids, all IV were taken as therapeutic measures for the events. The outcome of the events was recovering. The lot number for the vaccine, [BNT162B2], was not provided and will be requested during follow up.; Sender''s Comments: Based on the information provided and plausible temporal association, the causality between BNT162B2 and Headache, Dizziness, Neck pain, Fatigue, Nausea, Chills cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Write-up: Patient experienced a vasovagal reaction to the vaccine. 911 was called to further assess as patient displayed seizure like behavior as well. He lost consciousness momentarily. When he came to, he still was not able to respond well to our questions . His pulse was steady and his breathing was not labored. He threw up 3 times. His complexion was very pale. While EMS providers evaluated him, he continued to respond better to questions, regained his color, and was ultimately able to leave the clinic with his family. EMS determined that he experienced a vasovagal reaction and all his assessments came back within normal limits.

Write-up: About a week after receiving the first dose of the Moderna vaccine I began to feel ill. I don?t recall feeling any pain. My urine turned pink and I suspected I was bleeding, perhaps a UTI. When it continued for more than 2 days I went to a local urgent care clinic, saw a doctor there, submitted a urine sample for analysis and was sent home with a prescription for an antibiotic. However, the test result came back negative for bacteria and I discontinued the antibiotic. The bleeding eventually stopped. However, I did not feel well for several months, experiencing extreme fatigue well into the summer.

Previous Vaccinations:
Other Medications: Levothyroxine 75 MCG Sertriline 25 mg
Current Illness: n/a
Preexisting Conditions: history of asthma - however, not needed rescue inhaler in several years,

seasonal allergies, Hashimotos
Allergies: Madication: allergies to anything with menthol ex: Vicks, couph drops etc. also allergic to mint, catnip, almonds, hazel nuts, tree pollen, have had hives after taking medication with red-dye unclear if that was the cause
Diagnostic Lab Data: Thyroid levels checked - came back normal
CDC Split Type:
Write-up: Booster shot on 10/23/21 - on 11/3/21 woke with red itchy scalp took Claritan which helped - on 11/4/21 woke with red, raised hives. Took Claritan again - a few hours later it had gotten worse. Seen at doctor''s office given 8 day course of prednisone - hives continued throughout the 8 days - seen by allergist. Allergist did not believe it was in response to environmental or food cause given the length of hives and believed given my auto-immune history and history of getting hives likely due to something else that my body was reacting to such as stress or possibly the booster shot - but not able to be certain. Today is 11/11/21 - I am currently taking pepcid and Zyrtec with hives still occuring but not as severe - I would still get the booster again if deemed necessary.
