Write-up: Nausea; Vomiting; Based on the current case data, this case has been classified as invalid. This spontaneous case was reported by an other health care professional and describes the occurrence of NAUSEA (Nausea) and VOMITING (Vomiting) in a patient of an unknown age and gender who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. No Medical History information was reported. On an unknown date, the patient received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On an unknown date, received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On an unknown date, the patient experienced NAUSEA (Nausea) and VOMITING (Vomiting). At the time of the report, NAUSEA (Nausea) and VOMITING (Vomiting) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. No Concomitant product use was reported. Treatment information provided included Hydration and antiemetics. It was reported that it was patient''s second dose of Moderna vaccine, and the patient had a reaction to the vaccine which included Nausea and vomiting and visited the Emergency room for hydration and antiemetics. The vial from which the vaccine was taken was removed from the refrigerator and administered after it was in the refrigerator for a week. The refrigerator raged from 5.2C to 6.5C while the punctured vial was in it.

Allergies: Animal dander
Diagnostic Lab Data: None at this point.
CDC Split Type:
Write-up: On 10/4 was positive for COVID-19. ON 10/12 was diagnosed with COVID Pneumonia.

On 10/18 returned to work and was required to obtain the COVID Vaccine. Since under 30 days from the onset of COVID-19 Dr. stated unable to receive the first vaccine until 11/4. On 11/9 went to clinic to receive first dose even still having a cough from the Pneumonia and was document as having the cough and Polycythemia Vera. It was determined as stated I should be fine and the vaccine administered. On 11/10 in the early evening discovered a lump the size of an orange under my left arm at the lymph node. Waited a day to see if it would diminish which it didn''t and on 11/12 seek medical advice. Advice was given to fill out this form, and go to acute care. Acute care didn''t look at lump and made me a phone appointment with a doctor on the next day.

Write-up: I noticed that when I showered, I felt sort of like a burning sensation. My water wasn''t that hot, but it felt like I had a sunburn all over my body. It wasn''t like I had to jump out of the shower, but it was noticeable and weird. I did turn the water cooler and I still felt it. It went away once I got out of the shower. I didn''t have a rash or any hives. It was happening every time I took a shower where I felt like I had a sunburn. I tried to have the shower not be hot, but I''d still feel the sensation. I gave it time after calling the doctor, but it didn''t get better. This past week, when I was showering, I noticed it more on my hands and my face - those felt the hottest. But one night I felt it lying in bed. My body heat on the bed felt warmer than usual and the same kind of sensation. If I had one leg on top of the other, the bottom leg would get too hot. I didn''t have a fever during this or anything like that. If I moved or changed positions, or take a blanket off, it would go away. So, it

was a type of heat exposure, it seemed. I went to Urgent Care in the Hospital - they thought I was having a histamine reaction to heat. I have never had anything like that before. They put me on Zyrtec twice day for two weeks and also Pepcid - I can add that if Zyrtec doesn''t help on its own. They said right now it''s not dangerous but that it can happen and hopefully with allergy meds, it will help. I will have a follow up in two weeks to see if it''s better by then. Apparently on the 23rd, I think. It''s still the same. I have been taking the Zyrtec and the Pepcid twice a day for just a couple of days. They said it might take a while for it to go away.

CDC Split Type:
Write-up: Healthy pregnancy with no concerns, due 07/25/2021. Child born on exact date at 7lbs 8oz. Adverse event was severe chest pain, which gradually worsened over the first day. Felt painful to breathe deeply. Pain most severe when lying on left side. So severe that I could not tolerate that position for more than a second. Then chest pain resolved the following day for normal upright positions but continued when laying on left side until 03/11/2021. Initially, the cause of the pain was written off as heartburn. But I now believe it was pericarditis, due to the onset following vaccination and never experiencing anything else like it again for the duration of pregnancy.

Diagnostic Lab Data: Test Date: 20210428; Test Name: Blood pressure; Result Unstructured Data: Test Result:Blood pressure was high
CDC Split Type: USPFIZER INC2021486820
Write-up: Very dark, smelly urine; Very dark, smelly urine; Woke up with savage migraine; Severe neck pain; Severe kidney pain; Could barely walk; Blood pressure was high; Headache so bad; Nausea; Barely eat food; Sleep through all day and next night; This is a spontaneous report from a contactable consumer, the patient. A 49-year-old non-pregnant female patient received second dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EW0170) via an unspecified route of administration in the left arm on 26Apr2021, at 15:30 (at the age of 49-years-old) as dose 2, single for COVID-19 immunization. Medical history included lyme disease, babesiosis and bilateral kidney angiomyolipoma. The patient had known allergy to most antibiotic (unspecified), allergy to scallops and allergy to some prescription pain killers. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. Concomitant medications included herbal remedies (MANUFACTURER UNKNOWN) for Lyme disease from an unknown start date and unknown if ongoing. The patient previously received first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EW0150) via an unspecified route of administration in the right arm on 05Apr2021, at 12:00 (at the age of 49-years-old) as a single dose for COVID-19 immunization. On 28Apr2021, at 04:00 morning, the patient woke up savage migraine, severe neck pain and kidney pain due to which she could barely walk; on same day, the patient''s blood pressure was high, headache was so bad, which brought nausea to the patient. It was reported that, the patient drank lots of water but there was no relief, could barely eat food and sleep through all day and next night. On 29Apr2021 next day, the patient experienced very dark and smelly urine (which was never happened before) but she felt better, as if she would never been

sick the day before. Weird. The events did not result in doctor or other health care professional office/clinic visit, and emergency room/department or urgent care. Therapeutic measures were taken as a result of headache and included treatment with paracetamol (TYLENOL) from an unknown start date to an unknown stop date and the TYLENOL did not help while took twice. No therapeutic measures were taken as a result of other events. Since the vaccination, the patient had not been tested for COVID-19. On 28Apr2021, the patient underwent blood pressure test and the result was blood pressure was high. The clinical outcome of the events was unknown at the time of reporting. No follow-up attempts are needed. No further information is expected.

CDC Split Type:
Write-up: Given a 5-11 pfizer vaccine at 1:40 pm. At 1:50 HPM was called over to first aid station where pt had been taken. She c/o jaw pain and feelings of fear stating "Is something bad going to happen to me?". HPM instructed pt to lay down on cot. 1:55 pm: HR = 110; RR = 22 BP 106/80; O2 sat 99% Alert and oriented, Respiration unlabored, Skin warm and dry, facial paleness, no rash noted, capillary refill <2 secs. HPM reassured child that she was being taken care of and other clinic RN encouraged regular steady breathing. Jaw pain subsided and pt started to c/o upper left thigh pain which subsided when she bent her leg with knee to ceiling. Mother reports that pt has anxiety around unknown situations such as the vaccine clinic and has experienced similar symptoms of increased fear in the past. Observed for 30 minutes during which pt continued to voice concern stating "I"m really scared, am I going to be o.k. Voice clear and strong, c/o headache stating "this always happen to me when I get scared". Mom speaking calmly and quietly to child which was effective in bringing anxiety down. Mom verified verbally that pt gets a headache when she is upset. 2:20 HR = 92 BP 102/72. Skin warm and dry, facial paleness resolved, no rash noted. No further complaints of pain. Walked family to car and gave instructions about when to be concerned, when to call MD (anxiety continues), when to go to ER (rash, concerned), when to call 911(swelling of tongue, throat, trouble talking, drooling, trouble breathing, loses consciousness). Mom verbalized understanding.

CDC Split Type:
Write-up: Covid Arm. My right upper arm is swollen just under (about 2" below) the injection site. It is red and has a large lump that seems to be growing. It is very tender and there is a red rash like spot in the middle. Lump is approximately 4"x4" and the rash is just over 1"x1". My first 2 doses of the vaccine were Pfiser. This is my first Moderna shot.

CDC Split Type:
Write-up: Patient is an 11 yo child accompanied by his mother to a vaccine Clinic. This patient was administered the Moderna Booster dose of 0.25cc instead of the intended Pfizer pediatric dose for his age. Error identified after 15minute observation at exit. There were no adverse symptoms reported prior to exit from clinic and follow-up at 48 hours confirmed by patient''s mother that child has not had any symptoms develop since vaccination. Plan for scheduling second dose for Pfizer pediatric at 28 days per CDC recommendations.

CDC Split Type:
Write-up: Possible adhesive capsulitis s/p COVID vaccination. Had her second COVID vaccine on 5/13. She had more pain with the second dose than the first injection. C/o persistent pain in her left arm since. Started as pain at the area of injection--no redness or swelling. Immediately after her vaccine, she had a lot of body aches in her knees. That improved after about 1 week, but arm continued to feel sore. She felt like the shot went very deep on the second vaccine. For a while, her tricep was painful. ROM is impaired. She has been able to go about her normal activity. Over

the last 1 month, the pain has migrated into her deltoid muscle -- worse with sudden movements or reaching for something or catching herself. Hard to even run due to pain with running motions so it is now interfering with her daily life. Mostly bothered by aching pain. She has a sensation of numbness into her left wrist. No neck pain, back pain. She does have some left shoulder pain if she sleeps on her left side. She started using heat and ice over the last week. Using arnica and performing exercise. Is moving arm differently. Dorsal wrist is numb and tingly, sleeping differently. Fingers feel cooler. Is right handed, but also using left arm less due to discomfort.

Diagnostic Lab Data: Test Date: 20211120; Test Name: Blood work; Result Unstructured Data: Blood work detected pancreatitis
CDC Split Type: USMODERNATX, INC.MOD20213
Write-up: This spontaneous case was reported by a consumer and describes the occurrence of PANCREATITIS (each time I get pancreatitis/diagnosed with pancreatitis one day after third dose) in a 71-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 002F21A, 084M20A and 013L20A) for COVID-19 vaccination. Concurrent medical conditions included Immunocompromised. Concomitant products included AMITRIPTYLINE for Headache, BUPROPION HYDROCHLORIDE (WELLBUTRIN), SERTRALINE HYDROCHLORIDE (ZOLOFT), FOLIC ACID, COLECALCIFEROL (VITAMIN D3), DENOSUMAB (PROLIA) and RITUXIMAB (RITUXAN) for an unknown indication. On 28-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 24-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 19-Nov-2021, received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 20-Nov-2021, the patient experienced PANCREATITIS (each time I get pancreatitis/diagnosed with pancreatitis one day after third dose) (seriousness criteria hospitalization and medically significant). At the time of the report, PANCREATITIS (each time I get pancreatitis/diagnosed with pancreatitis one day after third dose) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 20-Nov-2021, Blood test: abnormal (abnormal) Blood work detected pancreatitis. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. The patient was treated with pain and Nausea Medication. Company''s comment: This is a Spontaneous case concerning a 71-year-old, female patient with medical history of immunosupresion under treatment with denosumab and rituximab and also receiving bupropion, amitryptiline and sertraline, who experienced the unexpected serious (hospitalization and medically confirmed and AESI) event of Pancreatitis. The event occurred approximately one day after the third dose of mRNA 1273 vaccine. This was confirmed by blood workup and patient is currently hospitalized due to it. Patient experianced Pancreatitis 3 days after the first dose and

also 4 days after the second dose of the mRNA 1273 vaccine (confirmed by blood workup). The medical history of imunosupression is a confounder for the event and the drugs bupropion and denosumab are co suspects. The benefit-risk relationship of mRNA 1273 vaccine is not affected by this report. This case was linked to MOD-2021-395640, MOD-2021-395647 (Patient Link). Most recent FOLLOW-UP information incorporated above includes: On 24-Nov-2021: Follow-up received contains added reporter information, patient demographic details, lab details, Suspect vaccine details added, concomitant medication added, Start date of event added, Hospitalization criteria for event added and Added Treatment medication in narrative.; Sender''s Comments: This is a Spontaneous case concerning a 71-year-old, female patient with medical history of immunosupresion under treatment with denosumab and rituximab and also receiving bupropion, amitryptiline and sertraline, who experienced the unexpected serious (hospitalization and medically confirmed and AESI) event of Pancreatitis. The event occurred approximately one day after the third dose of mRNA 1273 vaccine. This was confirmed by blood workup and patient is currently hospitalized due to it. Patient experianced Pancreatitis 3 days after the first dose and also 4 days after the second dose of the mRNA 1273 vaccine (confirmed by blood workup). The medical history of imunosupression is a confounder for the event and the drugs bupropion and denosumab are co suspects. The benefit-risk relationship of mRNA 1273 vaccine is not affected by this report.

Previous Vaccinations: Pt had a vasovagal reaction to the first dose of his COVID 19 vaccine series.
Other Medications: none reported by family.
Current Illness:
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Pt was vaccinated at our clinic and experienced an adverse reaction to the vaccine. Pt was in the exit area after his vaccine and began experiencing vasovagal symptoms. Pt also had a vasovagal response to his first vaccine. Pt vomited initially, but then reported he did not feel nauseous. Pt was brought to the floor so he could lay down. He was able to respond to questions and speak with his dad. He reported feeling drowsy. His vitals were stable. He remained at our clinic longer for evaluation. Eventually he was able to sit up in his father''s lap and left the clinic with his family. His dad was given instructions to continue monitoring him and let him rest afterward.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Client received 2nd dose in primary pediatric Pfizer vaccine series. Client was seated in chair when receiving vaccination. Approximately 2 minutes after administration, client lost consciousness, bumped head on back of chair and was lowered to the floor by parent and vaccinator. Client lost consciousness for approximately 15 seconds, but became fully responsive immediately after and was able to recall events prior to loss of consciousness. Vital signs were within appropriate ranges. An ice pack was provided for the client''s head, client had no complaints of concussion symptoms. Client was given a juice box and pretzels. Client remained in the exit area for 30 minutes to monitor for further adverse events. Client improved with food and drink and was released into the care of parent with recommendation to follow up with pediatrician if new symptoms present or worsen.

Current Illness: None
Preexisting Conditions: None
Allergies: Penicillin, Keflex, Zonalon
Diagnostic Lab Data: None
CDC Split Type: vsafe
Write-up: I didn''t get very sick with the first two injections. I was in bed for 36 hours after the third. My arm hurt like it would hurt after an injection- but that never went away. I started getting deep joint pain where I got the vaccine. I went back to see a doctor who I had seen for a shoulder injury previously with that shoulder. She didn''t seem to think that my presentation was similar to what she had seen me for before. It was a deep aching shoulder pain. I couldn?t lay on that side. It didn''t hurt to move my arm, but it was a deep aching pain deep within the shoulder joint. She scheduled me to go in for a steroid injection when I went to visit her on 11/18/2021, and she scheduled me for the following Tuesday. I never was able to get the steroid injection. The shoulder has progressively improved without the injection. Partially recovered.

Current Illness: COVID-19 breakthrough case
Preexisting Conditions: Dysautonomia since 2004 and COVID-19 post viral syndrome since Nov 2020
Allergies: Cymbalta, Benadryl, Zyrtec, Claritin, Cephalexin
Diagnostic Lab Data:
CDC Split Type:
Write-up: Had COVID-19 in Nov 2020. Vaccinated with Jansen shot in May, but got COVID-19 in August when my husband caught it at work. Our entire household (7 people, 5 vaccinated) caught it. I already had significant post-COVID-19 problems for months in August and was being treated by the local COVID-19 Clinic for dysautonomia, SIRS, vestibular nerve damage and chronic fatigue. This second COVID-19 made all my existing symptoms much worse, plus gave extreme weakness so I couldn''t get out of bed for 3 days. I could barely drag myself on the floor to get to the bathroom, just 5 steps from bed. Terrible chills, sweating, excruciating headache. They gave me a Pfizer shot on day 3 of this illness to help me get better immune response. The acute symptoms went on 2 days after that vaccine.

Other Medications: CALCIUM
Current Illness: Blood pressure high; Menopause; Tinnitus (Had history of tinnitus,when blood pressure was elevated and feels a pulse sensation in ears.)
Preexisting Conditions:

Allergies:
Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20213
Write-up: Sore arm; This spontaneous case was reported by a consumer and describes the occurrence of VACCINATION SITE PAIN (Sore arm) in a 50-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 043B21A) for COVID-19 vaccination. Concurrent medical conditions included Menopause, Tinnitus (Had history of tinnitus,when blood pressure was elevated and feels a pulse sensation in ears.) and Blood pressure high. Concomitant products included CALCIUM for Menopause. On 15-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On an unknown date, the patient experienced VACCINATION SITE PAIN (Sore arm). At the time of the report, VACCINATION SITE PAIN (Sore arm) had resolved. mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) dosing remained unchanged. Concomitant medications also included fiber supplement (to help with menopause). Treatment included Hydration. This case was linked to MOD-2021-396702, MOD-2021-396724 (Patient Link).

Preexisting Conditions: Medical History/Concurrent Conditions: Blood pressure high
Allergies:

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20213
Write-up: States she was in bed due to symptoms from 6pm Saturday until Tuesday night; experiencing nausea that was ongoing for 3-4 days; tinnitus in both ears; States the lymph nodes under armpit are swollen one lymph node is size of golf ball.; severe headache; chills; strong immune response; surrounding tissue is inflamed and swollen; surrounding tissue is inflamed and swollen; her upper left arm swelled; there are red blotches near vaccine site down to palms and hands; This spontaneous case was reported by a consumer and describes the occurrence of IMMUNE-MEDIATED ADVERSE REACTION (strong immune response), SWELLING (surrounding tissue is inflamed and swollen), INFLAMMATION (surrounding tissue is inflamed and swollen), PERIPHERAL SWELLING (her upper left arm swelled) and RASH MACULAR (there are red blotches near vaccine site down to palms and hands) in a 50-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 037F21A, 022C21A and 043B21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. The patient''s past medical history included Blood pressure high. Concurrent medical conditions included Menopause and Tinnitus (when blood pressure is elevated it feels like a pulse sensation in ears). Concomitant products included PLANTAGO OVATA FIBRE (FIBER SUPPLEMENT) and CALCIUM CARBONATE, COLECALCIFEROL (CALCIUM SUPPLEMENT WITH VITAMIN D) for Menopause. On 15-Apr-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 13-May-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 20-Nov-2021, received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. In November 2021, the patient experienced IMMUNE-MEDIATED ADVERSE REACTION (strong immune response), SWELLING (surrounding tissue is inflamed and swollen), INFLAMMATION (surrounding tissue is inflamed and swollen), PERIPHERAL SWELLING (her upper left arm swelled), RASH MACULAR (there are red blotches near vaccine site down to palms and hands), TINNITUS (tinnitus in both ears), LYMPHADENOPATHY (States the lymph nodes under armpit are swollen one lymph node is size of golf ball.), HEADACHE (severe headache) and CHILLS (chills). On 20-Nov-2021, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced NAUSEA (experiencing nausea that was ongoing for 3-4 days). On 20-Nov-2021 at 6:00 PM, the patient experienced BEDRIDDEN (States she was in bed due to symptoms from 6pm Saturday until Tuesday night). The patient was treated with IBUPROFEN (ADVIL [IBUPROFEN]) for Adverse event, at a dose of 2 pills every 6 hours. In November 2021, TINNITUS (tinnitus in both ears), HEADACHE (severe headache), CHILLS (chills) and NAUSEA (experiencing nausea that was ongoing for 3-4 days) had resolved. On 23-Nov-2021, BEDRIDDEN (States she was in bed due to symptoms from 6pm Saturday until Tuesday night) had resolved. At the time of the report, IMMUNE-MEDIATED ADVERSE REACTION (strong immune response), SWELLING (surrounding tissue is inflamed and swollen), INFLAMMATION (surrounding tissue is inflamed and swollen), PERIPHERAL SWELLING (her upper left arm swelled), RASH MACULAR (there are red blotches near vaccine site down to palms and hands) and LYMPHADENOPATHY (States the lymph nodes under armpit are swollen one lymph node is size of golf ball.) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular), the reporter did not provide any causality assessments. This case was linked to MOD-2021-396702, MOD-2021-396654 (Patient Link).

CDC Split Type:
Write-up: After flu like symptoms (headache, fever, chills, joint pain) had subsided, which were substantially worse than the previous 2 doses, the next night I woke up with pain and swelling in my knee around 11:50pm. It wasn?t that bad at first and was able to go to sleep again. I was then woken up by it around 2:30am and I couldn?t move my knee or use my leg and the pain was radiating into my ankle and hip. I had to lift my leg with my arms to be able to move it and could only keep it straight. I could barely limp to get Advil to try and reduce the swelling and pain. I wasn?t able to fall asleep again until around 5pm. If I could have driven (right leg) I would have gone to the hospital. When I woke up next the pain was reduced and centralized at the knee, can limp better but lateral movement creates a lot of pain.

CDC Split Type: USMODERNATX, INC.MOD20214
Write-up: A patient potentially received an expired Moderna vaccine past 24 hours in room temperature.; This spontaneous case was reported by a pharmacist and describes the occurrence of EXPIRED PRODUCT ADMINISTERED (A patient potentially received an expired Moderna vaccine past 24 hours in room temperature.) in a patient of an unknown age and gender who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. No Medical History information was reported. On an unknown date, the patient received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On an unknown date, the patient experienced EXPIRED PRODUCT ADMINISTERED (A patient potentially received an expired Moderna vaccine past 24 hours in room temperature.). At the time of the report, EXPIRED PRODUCT ADMINISTERED (A patient potentially received an expired Moderna vaccine past 24 hours in room temperature.) had resolved. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Concomitant medications were not provided. Treatment information was not provided. A vial was potentially left in room temperature for more than 24 hours.

Other Medications: Levoxyl
Current Illness: None
Preexisting Conditions: Hypothyroid, controlled with Levoxyl
Allergies: Citalopram, fluoxetine, sertraline
Diagnostic Lab Data: None
CDC Split Type:
Write-up: Started Wednesday 12/1 with thigh rash that spread upward to face; then chills started the next day 12/2; and on third night 12/3 severe both-hand swelling/pain/numbness/tingling, the swelling/pain was so bad could not sleep for more than an hour, fingers looked like sausages and I was afraid my skin would burst. It was nearly impossible to do daily activities. Monday 12/6 started over-the-counter meds (Aleve, Claritin, and Pepcid) that did not help much so Friday 12/10/2021 started steroids (methylprednisolone) and the steroids have significantly reduced the pain and swelling but the numbness and tingling in both hands persists and there is new swelling and small rash on left wrist. Outcome still to be determined as the steroids are a 6-day course and I am only on day 2.

Current Illness:
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: The patient, , arrived to the vaccinator table without guardian or teacher present. Parental consent and screening completed prior to patient?s arrival to vaccination site. Department of Health () staff member sat down next to child, due to child appearing anxious about vaccination. Both the vaccinator and staff member noted that child appeared nervous about vaccination and was crying lightly prior to vaccination but trying to hold in tears. Child was vaccinated successfully, and immediately following vaccination, child began crying more significantly. Within approximately 30 seconds, staff member and vaccinator noted localized erythema on right side of child?s neck. staff called over RN for further assessment of child. Upon RN assessment, RN also noted localized erythema on right side of child?s neck. No erythema was noted on torso or appendages. Patient denied experiencing any itchiness. No lip, tongue, or facial swelling was present. No signs of respiratory distress were present. Child stated that he felt ?fine,? but was nervous that so many people were surrounding him. RN sat with child for 15 minutes at vaccination table, with no worsening of localized erythema and no other symptoms noted in that time period. After 15 minutes, care was relinquished to school RN, who continued to observe child for an additional 15 minutes. School RN took child to nurse?s office, away from stimulating vaccination environment. School RN noted that child?s localized erythema began to subside when child left the stimulating environment and entered the quiet space of the nurse?s office. School nurse observed child for 15 additional minutes (30 minutes total from vaccination) and noted that localized erythema had completely resolved after the 30 minutes from vaccination. School nurse contacted child?s guardian, and guardian was informed of incident. School nurse and guardian made decision that child could stay at school for the day. School nurse and RN concur that this occurrence was most likely a stress response to vaccination.

Current Illness: Sore throat
Preexisting Conditions: Asthma
Allergies: None
Diagnostic Lab Data: No one asked for nothing. The doctor said she fainted ?out of impression?
CDC Split Type:
Write-up: She fainted right after a few seconds of getting the shot, and her body started to move like having seizures. Her eyes were half open but rolled up and her body was hard and tense. The doctor started yelling for help and oxygen while my child was unconscious . After a couple nurses came in and a few minutes passed, she woke up saying that she was very cold and she was feeling tired and weak. After this, she spent 14 days with a very bad rhinopharyngitis, I had to take her to the ER because of her complaining about not being able to breathe fine, chest pain and weakness.

Write-up: breakthrough infection detected 27Nov (PCR confirmed); breakthrough infection detected 27Nov (PCR confirmed); This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP) from product quality group. The reporter is the patient. A 15 year-old female patient (not pregnant) received bnt162b2 (BNT162B2), administered in arm left, administration date 05Jun2021 08:30 (Lot number: EW0217) at the age of 14 years as dose

2, single and administered in arm left, administration date 15May2021 08:30 (Lot number: EW0186, Expiration Date: 31Aug2021) as dose 1, single for covid-19 immunisation. The patient had no relevant medical history. There were no concomitant medications. The following information was reported: VACCINATION FAILURE (medically significant), COVID-19 (medically significant) all with onset 26Nov2021, outcome "recovering" and all described as "breakthrough infection detected 27Nov (PCR confirmed)". The event "breakthrough infection detected 27nov (pcr confirmed)" and "breakthrough infection detected 27nov (pcr confirmed)" was evaluated at the physician office visit. The patient underwent the following laboratory tests and procedures: sars-cov-2 test: (29Nov2021) positive, notes: Nasal Swab; (01Dec2021) positive, notes: Nasal Swab. Therapeutic measures were not taken as a result of vaccination failure, covid-19. Additional information: The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not receive other medications within 2 weeks of vaccination. No known allergies, no other medical history. No treatment was received. Prior to vaccination, the patient was not diagnosed with COVID-19. Product Quality Group provided investigational results on 03Dec2021 for BNT162B2: The complaint for lack of effect of the PFIZERBIONTECH COVID-19 VACCINE INJECTABLE lot EW0217 was investigated. The investigation included reviewing manufacturing and packaging batch records, deviation investigations, analytical release test results, and an analysis of complaint history for the reported lot. The final scope was determined to be the reported finished goods lot EW0217, the fill lot ET8456, and the bulk formulated drug product lot EP8638. A complaint sample was not returned. No related quality issues were identified during the investigation that had potential to impact product quality. All release testing performed prior to the release of the reported batch was within specifications. No root cause or CAPA were identified. The controls in place were determined to be sufficient in order to prevent complaints of this nature. The complaint for lack of effect of the PFIZERBIONTECH COVID-19 VACCINE lot EW0186 was investigated. The investigation included a review of manufacturing and packaging batch records, deviation investigations, and an analysis of complaint history for the reported lot and product type. The final scope included the reported finished goods lot EW0186, fill lot EP8736, and bulk formulation lot EP8617. A complaint sample was not returned. No related quality issues were identified during the investigation. There is no impact on product quality. No root cause or CAPA were identified as the complaint was not confirmed. All release testing performed prior to the release of the reported batch was within specifications.

CDC Split Type:
Write-up: Client presented to clinic on 12/13/21 for a 2nd dose of primary COVID vaccine series. Their CDC vaccination card indicated that she received a Moderna dose instead of the Pfizer pediatric (5-11 y) dose recommended on 11/22/21. As there was an error identified on 11/22/21 where a youth under the age of 12 received a Moderna booster dose (0.25ml) by the same vaccinator, the team concluded this was a similar error and informed the child''s mother, that the child probably received the Moderna Booster on 11/22 instead of the age appropriate vaccine. As CDC recommends that a 2nd dose be administered at a minimum of 24 days past the last Moderna dose, the parent was advised to follow up at an alternate clinic for the age appropriate dose. The team assist parent in locating an alternate clinic. Parent reports that child did not have any adverse effects from the first dose administered.

Current Illness: Had been experiencing tinnitus since COVID vaccine via Moderna #2, please see report 560886 , ID 1406331. Upon waking the morning after the booster , this time Pfizer, tinnitus was louder and continues to be loud and constant. Like a hive of bees with a high pitched tone as well.
Preexisting Conditions:
Allergies: Azithromyacin
Diagnostic Lab Data:
CDC Split Type:
Write-up: Upon waking the morning after the booster shot, I immediately noticed the ringing in my ears/tinnitus was markedly louder. It remains consistent and loud, a month later, like a hive of bees with a high pitch tone as well. It is challenging to sleep and to concentrate with this condition. I reported, at the suggestion of doctor, this symptom after the 2nd vaccine, note e report 560886 and ID 1406331. I have seen an ENT and an audiologist after the first report, no hearing loss of structural problems. I now take medication to sleep, run an air purifier on high for white noise. Doctor requested I report this incident as well.

Diagnostic Lab Data: Sent message to Dr via online chart - her reply: Hi , Thanks so much for getting us the information for your shots. So sorry that you had such a severe reaction. If it turns out we will need additional boosters in the future I recommend that you get the Moderna- it is 1/2 the original dose- Pfizer gave the whole dose. Have a happy holiday

CDC Split Type:
Write-up: Initially tight chest, left lymph node enlarged and headache early on. A little after 9 went to bed. Walking from Living room, bath to bedroom I was unable to breath - very short, little inhale/exhale struggle. Anxiety hit, rapid heart and felt as though I would be sick or pass out. I concentrated on my breathing to calm down. After about 4-5 minutes I was able to slowly lay down and stay in control of my breathing although it was a struggle. (I realized my phone was in kitchen and did not dare to move again) Slept off and on through out the night. Still continue to struggle breathing especially after walking or talking. Better then it was but I''m still very concerned I might have made a mistake taking the booster

CDC Split Type:
Write-up: An adult presented as a walk-in client for a Pfizer second dose. Vaccinator gave Pfizer (5-11) pediatric dose instead of the adult Pfizer second dose. CDC guidelines were reviewed. A second dose of Pfizer pediatric vaccine was given per CDC guidelines. Upon further review it was determined that the second dose should have been the Pfizer adult dose. CDC guidelines were vague regarding this point. The patient was immediately notified. She waited the appropriate amount of time after receiving the vaccine. No treatment was necessary. No adverse effects were noted.

Diagnostic Lab Data: none Mom called Dr. and left message as office is closed on Thursdays, and is closed until Tuesday due to the holiday weekend.
CDC Split Type:
Write-up: Second dose was given approximately 11:30am on 12/22/21 at a hospital run clinic. Patient was distraught to get a shot, but was in good spirits and health afterwards and completed her day at school. Around 11:30pm, she woke up screaming and calling for Momma/Dada saying she couldn''t stop shaking and that her legs felt "funny" and her "tummy felt yucky". When we saw her she was shaking as though she was shivering very violently and couldn''t stop. When we took her temperature it was normal. Skin felt fine. She looked ok, but very scared. Arm where injection was is tender/sore. (left) No redness or blotches etc on skin. No vomiting/diarrhea. No sore throat. No coughing. No runny/stuffy nose. No sneezing. She snuggled with her dad in a recliner with a blanket and watched a cartoon as a distraction to help her calm down. The shivers/shakes stopped completely in about one hour. Slowly (from top to bottom) as her dad says. (she had chattering teeth) She went back to bed with her mom so she''d have an adult nearby, around 1-1:30am Patient awoke around 4:30am moaning and complaining of a yucky tummy, and felt hot to the touch. Temperature was about 99-100F. Gave 2 Jr Advil (chewables) and she felt better and was "normal" until around 10:00am. Complained of feeling yucky again. No fever. 2 more Advil. Felt better. Returned to normal activities. Tired because of lack of sleep, but other than that she seems better.

Diagnostic Lab Data:
CDC Split Type: USPFIZER INC202101772669
Write-up: Passed out/Collapse; Really cold; Clammy; Headache; fall; feeling dizzy; Pale; booster; This is a spontaneous report received from a contactable reporter(s) (Other HCP). The reporter is the parent. A 16 year-old female patient received bnt162b2 (BNT162B2), administered in deltoid left, administration date 11Dec2021 (Lot number: FE3594) at the age of 16 years as dose number unknown (booster), single for covid-19 immunisation. The patient had no relevant medical history. There were no concomitant medications. Vaccination history included: Covid-19 vaccine (MANUFACTURER UNKNOWN, dose 1, single), for COVID-19 immunization. The following information was reported: IMMUNISATION (medically significant) with onset 11Dec2021, outcome "unknown", described as "booster"; LOSS OF CONSCIOUSNESS (medically significant) with onset 12Dec2021 07:00, outcome "recovered" (12Dec2021), described as "Passed out/Collapse"; NASOPHARYNGITIS (non-serious) with onset 12Dec2021 07:00, outcome "recovered" (12Dec2021), described as "Really cold"; COLD SWEAT (non-serious) with onset 12Dec2021 07:00, outcome "recovered" (12Dec2021), described as "Clammy"; HEADACHE (non-serious) with onset 12Dec2021 07:00, outcome "recovered" (12Dec2021), described as "Headache"; FALL (non-serious) with onset 12Dec2021 07:00, outcome "unknown", described as "fall"; DIZZINESS (non-serious) with onset 12Dec2021 07:00, outcome "unknown", described as "feeling dizzy"; PALLOR (non-serious) with onset 12Dec2021 07:00, outcome "unknown", described as "Pale". Clinical course: There were no prior vaccinations within 4 weeks. The patient did not even get her flu shot yet. The patient received the booster yesterday around noon and this morning, she just, out of the blue, she just collapsed, she passed out and she was really cold and clammy. Also, she had a headache. This has never happened before. The mother made sure that she gets her fluids. She was really cold and clammy. She just had her lie down in bed actually for like half an hour and just monitored her. The patient was cold, clammy and pale and she was dizzy and she has never had that. She passed out. They were upstairs in our bedroom and she hit the floor, we heard her, we heard her fall, it was a big bang and it was her on the ground.; Sender''s Comments: Based on known temporal association, there is reasonable possibility of causal association between the event Immunisation, Loss of consciousness, Nasopharyngitis, Cold sweat, Headache, fall, Dizziness, Pallor and the suspect drug BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Current Illness: N/A
Preexisting Conditions: N/A
Allergies: N/A
Diagnostic Lab Data: N/A
CDC Split Type:
Write-up: I prepared by being well hydrated and taking 2 Ibuprofen. My left arm was extremely sore after the booster injection. I drank water and took two Tylenol 4 hours after the booster was injected. The following day, 12/28/2021, I began to feel as if I had the flu. I had chills, muscle aches and joint pain. I wore several layers of warm clothing and still felt cold. I also had chest pains. This was very concerning to me. I had a rough night. Kept hydrated and took Tylenol every 4 hours. Sleep was in one hour segments. 12/29/2021 - I feel better today, but still have aches and chills. No chest pains. Please note that I had to submit to being "vaccinated" in order to stay employed. I want to be clear that this is the last time I will field test an experimental drug for a multinational drug company and suffer ill effects. Tell Pfizer to get more lab rats.

Preexisting Conditions: I am a kidney donor and have only 1 kidney.
Allergies: Penecillin, MSG, Keflex
Diagnostic Lab Data:
CDC Split Type:
Write-up: Extreme headache, fever, nausea, every joint ached - it was painful to even draw fingers into a grasp to hold a glass - lasted approximately 24 hours. Left upper arm where vaccine administered was completely swollen, red and hot for 48 hours - swelling reduced to size of baseball at 49 hrs. 800 mg of Tylenol given within 24 hr period. Did not address headache so I took 160mg of aspirin then waited 4 hrs and took another 160 mg of aspirin to reduce headache. Not supposed to take this med with 1 kidney but only option under conditions.

Current Illness: None
Preexisting Conditions: Head injury, anxiety
Allergies: None
Diagnostic Lab Data: EKG and vitals are ER on December 26th, everything looked normal.
CDC Split Type:
Write-up: Chest pain (central and left started Dec 24th and still experiencing slight central pain), left arm numbness and tingling on the inside (Dec 25- 26th lasted 2 days), swollen lymph nodes in left armpit, shortness of breath when sharp chest pains (24th-26th). I went to ER on Dec 26th for symptoms. They did an EKG, said everything looked normal and told it was likely a reaction to booster. It was effecting my musculoskeletal system. I was told to take ibuprofen and keep an eye out. Called PCP to follow-up with persistent chest tightness. Scheduled to be seen tomorrow, December 31st, to get a second look.

Other Medications: ClindaMax 1% topical lotion, 1 app, TOP, Once a day (at bedtime) Parnate 10 mg oral tablet, See Instructions, 2 refills, (2) 10 mg tab(s) Oral in morning (2) 10mg tabs in evening
Current Illness: None known
Preexisting Conditions: Depression IBS Covid 19 infection (per pt report) Breast cancer
Allergies: Sulfa

Diagnostic Lab Data: Negative Tick panel and covid pcr 5/7/21 Reported test done outside facility: CT abdomen and pelvis, CBC, CMP, TSH with cascade, CA 125, STI testing, MRI pelvis
CDC Split Type:
Write-up: Note 5/7/21:Patient is a 51-year-old woman who presents today for history of abdominal pain for the past 3 days. Patient also reports that she has had some pain with urination. Her bigger concern is that she had her second Covid 19 vaccine 3 weeks ago and became very sick. She reports that she had COVID-19 March 2020 and her symptoms from the vaccine were much worse. Her symptoms have included nausea, sore throat, body aches, ear pain, fatigue. She reports she was very sick initially and the symptoms have just lingered. Note 12/30/21: Patient reports that she tested positive for COVID-19 in March 2020. These records are not available. She reports she went on to have positive antibody testing at an urgent care center. Test also not available. Patient is requesting that I complete the vaccine adverse reaction form with the CDC. Patient would like to report following symptoms after her second shot: Chronic nausea, chronic food sensitivities, persistent sore throat, persistent body aches, persistent headache, shooting pains down bilateral arms, dyspnea on exertion and severe exhaustion. Patient reports that she has had several doctors and hospital visits not all of which are available to me now. She reports that she has had brain imaging and abdominal imaging which were done at an outside hospital. Patient reports that her most troublesome symptoms are her inability to eat food without intense nausea. She is concerned about weight loss which per our records has been 20 pounds in the past year. She is also concerned that there is some sort of inflammatory process occurring.

Previous Vaccinations: Pertussis/whooping cough vaccination series as an infant (had first shot, was lethargic-discontinued the course)
Other Medications: Biotin, lavender pills
Current Illness: None
Preexisting Conditions: Mild asthma (had not had a serious episode in 5 or 6 years)
Allergies: Pertussis/whooping cough vaccination allergy
Diagnostic Lab Data: 12/17/21-visit with dermatologist, full skin examination 12/23/21-PCR Covid test (due to breathing/coughing issues)-negative 12/28/21-PCP phone communication, prednisone prescription called in
CDC Split Type:
Write-up: 10 days after receiving COVID booster in right arm and flu shot in left arm, developed hives. I have never had hives before. Hives have been o ongoing for more than three weeks. Tried to control with benadryl and OTC creams but was mostly unsuccessful. Saw dermatologist on 12/17/21 who confirmed they are seeing an uptick in hives related to covid booster, i started a treatment regimine (allegra 360mg BID, benadryl in the evening). after a week there was improvement. i experienced a major setback on 12/23/21-hives started coming back worse, breathing problems (tight chest like breathing through a straw, extreme itchiness inside and outside my check, coughing) seeming like asthma started up and my right arm became extremely sore again for several days. my PCP prescribed 80mg oral prednisone daily on 12/28/21 for a seven day course i am currently on-i have seen major improvement in breathing and hives since then, but am still experiencing both of them in a mild form.

CDC Split Type:
Write-up: Shortly after the vaccine, not possible to exactly name the date, I began noticing some visual processing problems while driving. I thought it was perhaps related to my cataracts. One day I realized it was more than just processing as I saw while using the Amsler test that all the lines were distorted when looking with my right eye. I have been monitored for more than 15 years for macular degeneration and each year there has been no change. As a medical practitioner I keep up with current news and when I read that some doctors have been administering D-Dimler tests to check for blood clots after vaccination and that they have found evidence of small clots in a large percentage of people. Since wet macular degeneration is caused by leaking capillaries I think that it is important to find out how these vaccinations are affecting the small capillaries not only in the eye but other organs as well. We need more complete information. This is a major health concern and the fact that we have no long term data on these shots is what?s keeping many people from getting them.

Other Medications: calcium gummy supplement 500mg
Current Illness: None
Preexisting Conditions: history of kidney stones
Allergies: whey protein (milk, cheese, raw eggs)
Diagnostic Lab Data:
CDC Split Type:
Write-up: I received my third (booster) dose on Dec 31, 2021 and felt fine for about 12 hours. After that, I awoke with chills and fever around 1AM that prevented me from returning to sleep. By 3AM I experienced muscle aches as well. By 5AM the chills and fever had decreased, but the aches continued and I began to experience severe headaches and mild upset stomach. By 7AM the headaches had decreased to moderate. The headaches fluctuated from moderate to mild by 9AM, and the upset stomach dissipated. I continued to experience moderate muscle aches throughout my body as well as fatigue, headaches, and chills throughout the rest of the day. The second night (Jan 1) was better, I was able to sleep though still experienced continued aches, chills, and sweating. The next day (Jan 2) I had some muscle aches, but no further headaches or chills and I felt ready to resume normal daily functioning. I felt fully recovered by Jan 3.

Diagnostic Lab Data:
CDC Split Type:
Write-up: 12/14/21 Left arm pain, with immediate onset after injection of Covid vaccine, and has evidence for nerve injury or compression by the vaccine. Discussed the possibility of pursuing an EMG to further elucidate, but he declines. Symptoms are improving over time. 12/23/21 Left-sided radiculopathy pain and numbness thought possibly to be early zoster at last office visit, but never manifested rash. Question now of T4-T5 radiculopathy. Not worsening over time, but not getting better. Reviewed his literature citation of concern, and given lack of evidence of zoster, and also very rare case reports of zoster after Covid vaccine as an indicator of inflammatory arthritis, overall risks for this appeared to be very low. He is okay monitoring the left-sided dermatomal pain and potentially pursue physical therapy if persistent. EMG discussed, but declined given the painful nature of the procedure.

Other Medications: METOPROLOL; ELIQUIS; POTASSIUM
Current Illness:
Preexisting Conditions: Medical History/Concurrent Conditions: Anticoagulant therapy; Blood pressure abnormal; Potassium deficiency
Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021269135
Write-up: really shaky and felt like he might pass out; dizziness/got really dizzy and felt like he was going to pass out; tired; He went home and sat down because he was shaky.; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP) from medical information team. The reporter is the patient. A 72 year-old male patient received bnt162b2 (BNT162B2), administered in arm left, administration date 04Mar2021 11:00 (Lot

number: EN6200) at the age of 72 years as dose 1 single for covid-19 immunisation. Relevant medical history included: "blood thinner" (unspecified if ongoing); "blood pressure and controlling his pacemaker" (unspecified if ongoing); "potassium runs low" (unspecified if ongoing). Concomitant medication(s) included: METOPROLOL taken for hypertension; ELIQUIS taken for anticoagulant therapy; POTASSIUM taken for hypokalaemia. The following information was reported: FATIGUE (non-serious) with onset 05Mar2021, outcome "recovered" (07Mar2021), described as "tired"; TREMOR (non-serious) with onset 06Mar2021, outcome "recovered" (06Mar2021), described as "really shaky and felt like he might pass out"; DIZZINESS (non-serious) with onset 06Mar2021, outcome "recovered" (06Mar2021), described as "dizziness/got really dizzy and felt like he was going to pass out"; NERVOUSNESS (non-serious) with onset Mar2021, outcome "unknown", described as "He went home and sat down because he was shaky." Additional information: The caller stated he got his first shot on 04Mar2021 and had a side effect on 05Mar2021 of being tired. On 06Mar2021 he was really shaky and felt like he might pass out. On Sunday he was okay. He stated he has a pacemaker and called the cardiologist and they didn''t see anything different with the download and his cardiologist said he could get his second dose. The caller wanted to know if dizziness and shakiness was a side effect and if so what concern does he have for the second shot. Duration for really tired was 2 days. Metoprolol XL was given 75mg, twice a day, orally, Eliquis was 5mg, twice a day (morning and night), orally, KCC/ Potassium, 10mg, once a day, orally. Metoprolol XL: Started taking about a year and a half ago. Eliquis: He''s been taking for 3 years. KCC/ Potassium: He''s been taking for about 10 years.States that whenever he got really dizzy, felt like he was going to pass out. He went home and sat down because he was shaky. Metoprolol XL: Caller mentions he does get hits on his lower chamber of his pacemaker once in a while so it was supposed to help eliminate it. When proving indication for KCC, stated his potassium runs low because of the Eliquis. Eliquis: Does not see NDC/LOT or EXP. Clarifies it was dispensed in a pharmacy bottle. Stated he needed to grab his reading glasses to read the bottle Dispense date: 20Oct2020 Use by: 20Oct2021. he doesn''t think so, he has had a couple of ablations but went to the pacemaker after a couple of ablations. No follow-up attempts are possible. No further information is expected.

Previous Vaccinations: Rash on the backs of both arms and legs following flu shot in Jan 2021
Other Medications: None
Current Illness: None
Preexisting Conditions: None but overweight
Allergies: I had an allergic reaction to my most recent flu shot in January 2021. Shortly after receiving the flu shot, I developed rash down the vaccinated arm and within a few days, I developed rash down the opposite arm as well as on the backs of both knees
Diagnostic Lab Data: None
CDC Split Type:
Write-up: Three days after vaccine administration, I woke with stiffness / arthritic tips of fingers on right hand and toes on right foot. The joint stiffness continued to get worse on my right side and on the eleventh day after vaccination, I developed sciatica so badly that my right leg was so weak and could not be used to go up stairs; walking and sitting / standing were extremely painful. The sciatica and neuropathy / arthritic joint pain went away on my right side at approximately eighteen days after vaccination. But then the joint stiffness / neuropathy emerged on my left side (in the tips of fingers on my left hand and in the toes on my left leg). Within a few days I then also developed intense pain in my left hip joint which made it difficult to move my left leg. These symptoms went away as of six weeks after vaccination. Today is my seventh week after vaccination and the only lingering symptoms are slight neuropathy / stiffness in the tips of my fingers and toes on my right

side.

Write-up: almost instantly as soon as the shot was administered I had a pain in the top of my hand that lasted the entire day. Approx 30 minutes after the vaccine I was home and had tingles like pins and needles in my body at different locations. I also had the palms of my hands were both all blotchy red and burned a little and itched a little but the biggest issue was they were blotchy red almost like hives but not. these issues lasted approx 3-4 days. I spiked a low fever which corrected on its own and had an terrible headache for 2 days. Im on day 17 post booster vaccine and approx 3 days ago i started having some numbess and or cold feeling on my buttocks as if you had been sitting for hours on a chair or a feeling as if you were outside in the cold and came inside..hard to explain. and for 2 days now i have faint constant ringing in my ears. Not sure if the most recent effects are from the booster as its been 2 weeks when these started however the first few were almost immediate.

Allergies:
Diagnostic Lab Data:
CDC Split Type: USJNJFOC20220107552
Write-up: EPILEPTIC SEIZURE; This spontaneous report received from a patient concerned a 60 year old male. The patient"s height and weight were not reported. Concurrent conditions included: high blood pressure and epilepsy. The patient had no known drug allergies (NKDA). The patient had been diagnosed with epilepsy back in 2016 and has been on medications for it for the past 5 years. He states he has not had a seizure since he has been on the medication for it. The patient previously received with covid-19 vaccine ad26. cov2. s (Dose number in series 1) (suspension for injection, route of admin not reported, batch number: 043A21A and expiry: unknown) dose was not reported, 1 total, administered on 10-APR-2021 for prophylactic vaccination. It was unknown whether patient had any adverse events following primary vaccination with covid-19 vaccine ad26.cov2.s (Dose number in series 1). The patient received booster of covid-19 vaccine ad26.cov2.s (suspension for injection, route of admin not reported, batch number: 1822809, and expiry: unknown) dose was not reported, 1 total, administered at right arm on 16-DEC-2021 for prophylactic vaccination on right arm (dose number in series 2). The patient has high blood pressure and for which he was on two blood pressure medications. On Saturday night of 18-DEC-2021, patient experienced an epileptic seizure (Dose number in series 2). Patient stated that, he was disoriented after the seizure but was fine afterwards and he could hear his wife after the seizure. The patient went to work Monday and Tuesday before hearing back from physician. He took Keppra (levetiracetam) 1000mg twice a day and before that he was on 750mg of Keppra twice a day. The patient stated that, due to seizure and his work he cannot be on the road for at least 3 months. The action taken with covid-19 vaccine ad26.cov2.s was not applicable. The

patient recovered from epileptic seizure. This report was serious (Other Medically Important Condition).; Sender''s Comments: V0: 20220107552- Covid-19 vaccine ad26.cov2.s-epileptic seizure. This event is considered unassessable. The event has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There is no information on any other factors potentially associated with the event

Other Medications: none
Current Illness: none
Preexisting Conditions: had some episodic chest wall pain over the course of 2-3 years, negative cardiology workup including echo.
Allergies: tree nuts, medical adhesive (Zio patch), blackberries (all yielding rash)
Diagnostic Lab Data: 1/3/22 troponin negative 1/5/22 CBC , CMP, ESR, CRP, TSH normal 1/14/22 ANA, RF, CBC reordered; results of first two could take 5 days or more to return (rural area)
CDC Split Type:

Write-up: Pt presented to emergency dept 3 days after vaccination with acute chest wall pain, acute coronary syndrome ruled out, pericarditis/myocarditis ruled out. He had a very tender, nonerythematous firm chest wall mass at the right costochondral junction that has been present from 1/3 to date (1/14/22). Ultrasound showed no pericarditis in ED; chest xray was unremarkable. He simultaneously had a rash on his upper shoulders that when I saw him on 1/10 looked like pityriasis (pink-tan macules, ovoid, no scale, nontender, not itchy. At one point this looked like another clinician like urticaria, but the flat macules that were present on my exam were not itchy and were persistent over days. He has had no fever or chills, but has had, since the vaccine, episodic and relatively quickly resolving (over 1-2 days) swelling of the elbow, and the nasal bridge. He does have a single palpable cervical lymph node. -originally entertained possibility of Tietze"s syndrome after case of pityriasis but with extremity joint involvement and nasal bridge swelling find this now less likely -ddx does include relapsing polychondritis but no vestibular/acoustic/otic or ophthalmic involvement; also quite rare. Appreciate the work of our public health colleagues.

CDC Split Type:
Write-up: The patient, arrived to vaccine clinic with two para-educators. Verbal consent and screening checklist completed over the phone with patient''s mother. Mother reported a history of patient fainting following the patient''s second Covid vaccine, and mother reported that patient improved after drinking apple juice. Mother also reported that patient has Down Syndrome. Plan was made by clinic staff to provide patient with apple juice and pretzels while at the vaccination table, to have an area nearby for patient to lie down if needed, and for patient to wait her 15 minutes at the vaccination table, so that she would not have to walk to another area following vaccination. Patient arrived at vaccination table with two para-educators and began sipping on apple juice and snacking on pretzels. Patient received Pfizer vaccine without issue. Patient continued sipping apple juice and snacking on pretzels while waiting her 15 minutes and talked with vaccinators and para-educators. After 13 minutes had passed, patient stated that she began to feel dizzy, so patient lied down on the floor with her feet up, with the assistance of the clinic staff. Patient''s skin appeared pink, and patient was able to open eyes and talk with clinic staff. Para-educator stated that "this might be an attention-seeking behavior." Patient lied on floor for approximately 5 minutes with clinic staff attending to her. After 5 minutes, patient reported that she was feeling better, and not dizzy anymore. Patient was sat up slowly by clinic staff and sat on the floor for approximately 5 minutes, with observation from clinic staff. Patient then was moved to a chair with the assistance of two clinic staff. Patient sat in chair for an additional 2-3 minutes, without issue. Patient was then walked across the room to sit in another chair, with the assistance

of two clinic staff. Patient reported feeling fine. At that time, para-educators assumed care of the patient, and patient left the clinic reportedly feeling "better."

Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021301085
Write-up: Upset stomach; soreness at injection site; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP). The reporter is the patient. A 68 year-old male patient received bnt162b2 (BNT162B2), administered in arm right, administration date 13Mar2021 16:00 (Batch/Lot number: unknown) at the age of 68 years as dose 1, single for covid-19 immunisation. Relevant medical history included: "Haemodialysis", start date: Jun2012 (unspecified if ongoing); "Open heart surgery" (unspecified if ongoing); "Heart valve replacement", start date: 2017 (unspecified if ongoing); "pacemaker", start date: 2017 (unspecified if ongoing). The patient took concomitant medications. The following information was reported: VACCINATION SITE PAIN (non-serious) with onset 13Mar2021, outcome "recovered" (15Mar2021), described as "soreness at injection site"; ABDOMINAL DISCOMFORT (non-serious) with onset 15Mar2021, outcome "not recovered", described as "Upset stomach". Additional information: Patient was having side effects from the Covid-19 vaccine. He had soreness at the injection site. He was unsure if it was what he ate or a reaction to the vaccine. Yesterday he had an upset stomach. He read where that was mentioned in the paperwork. History of all previous immunization with the Pfizer vaccine considered as suspect was reported as none. Additional Vaccines Administered on Same Date of the Pfizer Suspect was reported as none. Prior Vaccinations (within 4 weeks) were reported as none. Relevant Tests were reported as none. Patient was unable to clearly read the handwriting on the card as it was illegible. He think the Lot was EL92CR1. No follow-up attempts are possible; information about lot/batch number cannot be obtained. No further information is expected.

Diagnostic Lab Data:
CDC Split Type:
Write-up: I was vaccinated in January 2021and I received both Pfizer shots. But a month later I started getting these little painful raised sore spots on my scalp. After about a month they opened up and turned into rings after two months it had left a hole. Also had very sharp stabbing pains in abdomen and skin wet very numb and tingly. Got vaccinated again in June 2021, The same thing happened again of course on the scalp, raised sore spots that repeated what I explained above. They both took three months or more to heal yeah leaving holes where they were. Got the booster

shot and the same thing happened again only a little more intense. As I sit here writing an hour I have lesions on my scalp that are painful and have opened up and will turn into holes. Eventually I''m thinking they will scar over completely. I believe it''s the vaccine that has done this. As explained above the sharp pains in my abdomen. I''ve never experienced any of these issues before until I got the vaccines. Also I am starting to get tingly fingers like I''m losing feeling in my hands and I get a deep sharp ache in my forearms. I don''t know if this is linked to the shots, but it did start after the second time I was vaccinated and after the booster shot. As for the scalp lesions they happened from the first vaccine doses, the second vaccine doses and the booster shot. I don''t know if my immune system got over reactive or overactive. Pardon my non-medical term use of words lol I''m not school with medical terms. I am quite worried that this is going to happen to leave holes in my scalp. I hope this helps. I was wondering if this is happened to anybody else? I was wondering if anyone else had issues with scalp lesions?

Current Illness: None
Preexisting Conditions: Asthma
Allergies: None
Diagnostic Lab Data: None
CDC Split Type: vsafe
Write-up: It started as a bilateral hand rash. I used some topical corticosteroid that had previously been prescribed for eczema. That went on for 2-3 months where it was smoldering and it never went away completely even though I was using those medications. That actually went on for several months. Started in April or May and coincidence with other health event. That same week, it completely exploded and became way worse than it had ever been (Late August). I had a recommendation from another friend to try a higher dose steroid and tried that on my hand and that kept things at a low rumble but it never really went away. At that time I was also having a bilateral lower and upper extremity skin rash and trunk. It was predominantly extensor surfaces. I went to see a dermatologist, a different one at that point and he prescribed a different corticosteroid and used that for another 1-2 months and it improved and never went away on the hands. Went back to see him in follow up and it had been a couple months at that point and he said to keep using it. Around that time, he also put me on high dose on antihistamines. Hydroxyzine at night. Dermatologist is stumped, being sent back to PCP as well as an allergist.

CDC Split Type: USMODERNATX, INC.MOD20224
Write-up: This spontaneous case was reported by an other health care professional and describes the occurrence of VACCINATION SITE DISCOMFORT (discomfort in their injection arms), HEADACHE (headache), EXPIRED PRODUCT ADMINISTERED (booster doses of Moderna vaccine stored in the fridge past 30 day BUD administered to 3 patients) and PRODUCT STORAGE ERROR (booster doses of Moderna vaccine stored in the fridge past 30 day BUD administered to 3 patients) in a 63-year-old patient of an unknown gender who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 058H21A) for COVID-19 vaccination. No Medical History information was reported. On 14-Jan-2022, the patient received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 14-Jan-2022, the patient experienced EXPIRED PRODUCT ADMINISTERED (booster doses of Moderna vaccine stored in the fridge past 30 day BUD administered to 3 patients) and PRODUCT STORAGE ERROR (booster doses of Moderna vaccine stored in the fridge past 30 day BUD administered to 3 patients). In January 2022, the patient experienced VACCINATION SITE DISCOMFORT (discomfort in their injection arms) and HEADACHE (headache). On 14-Jan-2022, EXPIRED PRODUCT ADMINISTERED (booster doses of Moderna vaccine stored in the fridge past 30 day BUD administered to 3 patients) and PRODUCT STORAGE ERROR (booster doses of Moderna vaccine stored in the fridge past 30 day BUD administered to 3 patients) had resolved. At the time of the report, VACCINATION SITE DISCOMFORT (discomfort in their injection arms) and HEADACHE (headache) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Vaccine was stored in the fridge (4.7 C) since 03-Dec-2022. All three patients stated discomfort in their injection arms and had no fever or no chills. The patient had headache the next day. No concomitant medication information was provided. No treatment medication information was provided. Most recent FOLLOW-UP information incorporated above includes: On 19-Jan-2022: Follow-up received: Reporter details, patient age and events updated.

CDC Split Type: USPFIZER INC2021329550
Write-up: headaches; fast heart rate; This is a spontaneous report received from a contactable reporter(s) (Consumer or other non HCP) for a sponsored program Support. The reporter is the patient. A female patient received bnt162b2 (BNT162B2), administration date 15Mar2021 (Batch/Lot number: unknown) as dose 1, single for covid-19 immunisation. The patient"s relevant medical history and concomitant medications were not reported. The following information was reported: HEADACHE (non-serious), outcome "unknown", described as "headaches"; HEART RATE INCREASED (non-serious), outcome "unknown", described as "fast heart rate". Relevant laboratory tests and procedures are available in the appropriate section. Additional information: Patient got her 1st dose and she experienced headaches and a fast heart rate for like a day or two. And the fast heart rate scared her. She"s scheduled to get her 2nd dose on 5Apr2021, and she wants to know if the side effect will be the same or will there be a more intense side effect. She wants to know the severity of the side effect of the 2nd dose. No follow-up attempts are possible; information about lot/batch number cannot be obtained. No further information is expected.

Current Illness: None
Preexisting Conditions: Psoriasis 13 years
Allergies: None
Diagnostic Lab Data:
CDC Split Type:

Write-up: Pulsatile tinnitus 8000 Hz developed in both ears 2-3 days after booster shot. Louder in left ear than right. Noticeably louder in mornings, but still loud even when driving with studded winter tires and the heater on. Only stops pulsing while I yawn and becomes a steady whine. When yawning stops, goes back to pulsatile. Has not diminished in severity since it developed. Have not gone to a doctor. Waiting for it to resolve (hopefully)

CDC Split Type:
Write-up: Though previously very active/athletic and in good health, I began experiencing noticable muscle and joint stiffness/pain in neck, hips, lower back, knees, thighs, hamstrings in June 2021. Stiffness/pain became progressively worse over the next few months and eventually

spread to shoulders/upper back and upper arms. Bloodwork ordered by my PCP in September 2001 suggested an autoimmune disorder. PCP suspected Polymyalgia Rheumatica, but noted that this would be very unusual for someone under 50. She referred me to a rheumatologist for further evaluation and diagnosis. I had my initial rheumatologist visit in December 2021, and medical team confirmed the diagnosis of Polymyalgia Rheumatica (though noted that this is highly unusual in someone my age). I began a course of Prednisone treatment (15 mg/day) on December 29, 2021 and am currently at the start of a taper.

Write-up: Medical Assistant, mistakenly diluted the pfizer vaccine at 2:00pm, January 27th, 2022. The new Pfizer formula is not to be diluted. It was our 1st shipment of the new pfizer tris-sucrose formula. I made the mistake out of the habit of previously having to dilute pfizer vaccine formula. There were no adverse reactions following the 15 minute observation time with the patient. I was reading through information on the CDC about what to do in this situation. The information took some time to find so I let the patient leave the office after the 15 minute observation time since they were not experiencing any adverse reactions. I explained to them that the administration of this particular vaccination was more than likely invalid because it was diluted. I told the patient we would call to reschedule as soon as we knew more information. We are attempting to reach the patient now to reschedule a pfizer booster shot as soon as possible.

CDC Split Type: USMassBiologicsAE2102
Write-up: Ear infection; Hearing loss; Intermittent cold feelings; Intermittent pain feelings; Cellulitis; Felt Unwell; Chronic Fatigue; Extreme Exhaustion; Muscle cramp in right foot; Unable to function; Hashimoto''s Disease Exacerbated; Initial Telephone Call, 20 May 2021 Pt. reported that on 03 May 2021 she was administered TDVAX (MassBiologics lot #A125A) in her left arm for wound management after injury by a rusty nail. After vaccine administration, she started to feel unwell and continued to feel unwell. She was experiencing chronic fatigue and extreme exhaustion, keeping her from performing daily activities. Her fatigue was followed by muscle cramping in her right foot, treated with Diazepam. She had received Tdap on 10APR2013 along with rabies, hepatitis and typhoid vaccines which lead to some unspecified reaction. The healthcare provider thought that it was related to the rubber stopper of the rabies vaccine and not to Tdap vaccine. Pt. reported that she has Ehlers-Danlos Syndrome, Hashimoto Disease, and Fibromyalgia. On 21 May 2021 Pt. called to inform MassBiologics that she had been in the emergency room (ER) three times in the last 24 hours after being stung by mud wasps. Within a day of having been stung, she developed cellulitis on her left ear (which she noted was at the same side as initial vaccination), and on her right elbow. Pt. was not sure if the cellulitis was related to vaccination. She stated that she was consulting her doctor because she might be borderline anemic. Follow-up Telephone Call, 24 May 2021 MassBiologics reached out to pt. to clarify the timeline of the wasp stings and ER visits. She stated that on 19 May 2021 she received multiple stings on both forearms and biceps, the right elbow and left ear. By 20 May 2021, she had developed cellulitis on the left ear and right elbow resulting in an ER visit on the same day. She was prescribed Benadryl and sent home. Her cellulitis continued to worsen, so she returned to the ER at 1:30 AM on 21 May 2021 where she was prescribed antibiotics. During this visit her labs were also taken and showed elevated TSH levels due to which she returned to the ER in the afternoon of 21 May 2021. Follow up lab results showed that TSH levels now has been dropped to its normal level. She stated that her endocrinologist was confused by these TSH results and thought that Td vaccine may have exacerbated her Hashimoto''s Disease. Further Follow-ups MassBiologics reached out to pt. several times to check her status but she did not answer calls on

4 Jun 2021, 7 June2021, 26 Jul 2021 or 28 Jul 2021. Pt. was contacted via email on 2 Aug 2021. On 6 Aug 2021, she contacted MassBiologics to follow up on the current status of the adverse events. She stated that she was "back to being herself" and that the originally reported events seemed to have resolved. Upon being asked for more details on her ER visits and the medication prescribed, pt. explained that she was prescribed Cephalosporin during her visit to ER on 21 May 2021 and during the course of taking the Cephalosporin she began to experience a cold feeling, pain and some hearing loss in her left ear. She visited the ER on 16 June 2021 because the cold feeling and pain did not subside. She was diagnosed with a middle ear infection. She was prescribed, to the best of her recollection, ZPAK for duration of 10 days. Upon continuation of the cold feeling and ear pain, she followed up with her health care provider on 22 July 2021. During this examination, fluid was noted in her ear. She was prescribed Levaquin. As of 6 Aug 2021, pt. was still experiencing significant hearing loss, intermittently feeling cold and pain. During this call she expressed the intention to follow up with ENT specialist. On 01 Oct 2021 MassBiologics contacted pt. to determine her current status. She reported that her initially reported AEs had resolved and that she was feeling much better than a couple of months ago. She stated that her left ear no longer feels infected but that she was concerned that some hearing loss persisted.; Sender"s Comments: The adverse event reported in this case was assessed as follow: 1) Chronic Fatigue, was assesed as Non-serious and Labeled. 2) Rest of the AEs were assessed as Non-serious and Unexpected.

Write-up: the reporter is hesitant about getting the 2nd dose of his Shingrix vaccine after his reaction, the 6 month window for the second dose has passed.; Experience hives on his hands and torso; Swelling around his lips; Insomnia; This case was reported by a consumer via call center representative and described the occurrence of hives in a male patient who received Herpes zoster (Shingrix) for prophylaxis. Co-suspect products included Herpes zoster (Shingrix)

for prophylaxis and prednisone for hives and lip swelling. On 28th June 2021, the patient received the 1st dose of Shingrix (intramuscular) 50 ?g. On an unknown date, the patient received the 2nd dose of Shingrix. On 29th June 2021, the patient started prednisone at an unknown dose and frequency. In June 2021, less than a day after receiving Shingrix and not applicable after receiving Shingrix, the patient experienced hives, lip swelling and insomnia. On an unknown date, the patient experienced incomplete course of vaccination. The patient was treated with benadryl (nos) (Benadryl). The action taken with prednisone was unknown. On an unknown date, the outcome of the hives, lip swelling and insomnia were recovered/resolved and the outcome of the incomplete course of vaccination was unknown. It was unknown if the reporter considered the hives, lip swelling and insomnia to be related to Shingrix. Additional details were provided as follows: The patient self reported this case. The age at vaccination was not applicable for 2nd dose of Shingrix. The patient received his first dose of Shingrix into his right arm at his pharmacy and within 12 hours of receiving the injection, he began to experience hives on his hands and torso, and swelling around his lips. The patient went to the urgent care the next day and his physician started him on prednisone. After 3 days with no relief from hives while on prednisone and due to the insomnia the patient was now experiencing, the physician told him to take Benadryl. On the fourth day after the injection and after taking the Benadryl, the hives and swelling resolved. The patient was hesitant about getting the 2nd dose of his Shingrix vaccine after his reaction, the 6 month window for the second dose had passed. Till the time of reporting, the patients did not receive 2nd dose of Shingrix, which led to incomplete course of vaccination. The patient did not had the lot or expiration date of the vaccine administered. The reporter consented to follow-up. It was unknown if the reporter considered the hives, lip swelling and insomnia to be related to Prednisone.

Previous Vaccinations: After getting the 2nd dose of Moderna Covid-19 vaccine on 04/08/2021; same symptoms as those reported above, but I didn''t know h
Other Medications: Levoxyl, Vitamins B12, D3, C
Current Illness: macrocytic anemia, thrombocytopenia
Preexisting Conditions: osteoarthritis; Hashimoto''s hypothyroidism
Allergies: erythromycin, sulfa drugs
Diagnostic Lab Data: I called the doctor''s office requesting a referral to cardiology, but haven''t heard back from anyone. I don''t know if the symptoms I''m experiencing are from the vaccine, but it''s a heck of a coincidence.
CDC Split Type:
Write-up: 12 hrs after shot I awoke with fever that rose to 102.5? staying elevated for many hours. I was bedridden, too weak to be upright. I rested & drank water. Next day my temp returned to normal, but I started experiencing erratic heartbeats? rapid, fluttering heartbeats on a daily basis. I feel unusually tired, am short of breath at times, have joint pain and mild swelling in my legs. I feel a sensation of pressure in my upper left chest &, at times, chest pain. I had some of these same symptoms after the 2nd dose of the Moderna vaccine, but milder, and I didn''t know to ascribe them to the vaccine. These symptoms are more severe this time. Do I have myocarditis? I don''t know. I got the 2nd dose on 4/8/21. I had the fever 12 hrs after 2nd dose. The rapid heartbeats were not immediately following.

Current Illness: None
Preexisting Conditions: Type 1 Diabetes Mellitus
Allergies: None
Diagnostic Lab Data:
CDC Split Type:
Write-up: At time of shot, blood glucose level was at 160. I drank a 20oz soda which was 60 grams of sugar and carbs. To cover the soda I took 3 units of insulin instead of the full 6 units I would normally take. At this time which was 12:45PM I did not have any active insulin in my system. At 2:45PM I had 2 slices of bread with peanut butter and no insulin. At 3:15PM I felt light headed and dizzy so I checked my blood glucose levels and it was 46. I ate an entire bowl of cereal and drank 2 tbsp of maple syrup. After the hypoglycemia incident, I tested my blood sugar at 3:30 and it was 94.

Diagnostic Lab Data: Was given IV Fluids in the ER on 11/25/2021
CDC Split Type:
Write-up: Fainted in chair right after the booster. Threw up several times within minutes of the vaccine. Was held at facility for several hours and got sick several times after. Husband picked me up as I could not drive. Was sick for several days, contacted my physician and she recommended I go to the ER on 11/25/2021 as I could not hold down water and was dehydrated - directly attributable to being sick from the Booster shot.

CDC Split Type: USGLAXOSMITHKLINEUS202201
Write-up: 1st dose 2018, 2nd dose 12Oct2021; This case was reported by a pharmacist via call center representative and described the occurrence of drug dose administration interval too long in a 55-year-old female patient who received Herpes zoster (Shingrix) (batch number 7742Z, expiry date 25th March 2023) for prophylaxis. Previously administered products included Shingrix (1st dose received on 9th November 2018). On 12th October 2021, the patient received the 2nd dose of Shingrix. On 12th October 2021, unknown after receiving Shingrix, the patient experienced drug dose administration interval too long. On an unknown date, the outcome of the drug dose administration interval too long was unknown. Additional details were provided as follows: The reporter stated that a patient received the first dose of Shingrix on 9th November 2018 and the second dose on 12th October 2021, which led to lengthening of vaccination schedule. The lot and expiration was not available for the first dose, but the lot and expiration of dose 2 was as follows: 7742Z, 25th March 2023 . The reporter noted the lot number was difficult to read, so it might not be accurate, but that was what the numbers appear to be. The reporter consented to follow up from safety.

Write-up: The night of the 29th, I got really itchy and it was happening on my chest, stomach, legs, and everywhere. It was dark so I didn''t realize it was hives; so I went to shower and moisturize to think it was would relieve the itch. I noticed it was hives and called my doctor who scheduled me an appointment for 12/05/2021. I was prescribed Loratadine and Hydroxyzine to help the itch and hives. Over the next couple of weeks, it was still intense itching that came and left on its own. 3 weeks later on 12/20/2021, I went back to the doctor''s office and showed them pictures of raised skin reaction. They didn''t change my medicine or anything, but informed me if anything gets worse to go see an allergist. They said I had dermatographism- histamine reaction if you scratch or put pressure on aching skin. On 01/03/2022, I stopped taking Loratadine and started taking Zyrtec. The Zyrtec is helping and has reduced the itching significantly. If I do have an itch, it''s not persistent as it was before and goes away.

Previous Vaccinations: somewhat acute reactions to childhood vaccines
Other Medications: None
Current Illness:
Preexisting Conditions: Atrial Fibrillation, Hypertension
Allergies: Adverse reaction to previous vaccines
Diagnostic Lab Data: Unable to seek any medical care due to inability to mask and my insurance deductible is so large I could not afford to seek care. Damage seems to be permanent 9 months after vaccine.
CDC Split Type:
Write-up: Within one hour very large double bruises on upper arm slightly below injection site. At 1.5 hours headache that was incapacitating as well as nausea, weakness and double vision. Inability to eat properly for about 21 days. Headache continues to this day on a daily basis since it''s start. One large bruise still highly visible. On injection arm frequent and random small blood vessels rupturing. Chronic fatigue and unwell feeling. Had to resign from full time job due to

reduced ability to drive and perform general daily functions with any reliability. Only able to work on days that I feel well enough to drive and function, around 2 half days per week in a normal week.

Other Medications: Sertraline, vitamin D
Current Illness: none
Preexisting Conditions: none
Allergies: Oranges, penicillin
Diagnostic Lab Data: None yet. Only just finally got a referral to hematology. No one had any concern with hair loss (except me!!).
CDC Split Type:
Write-up: Hair loss started about three weeks after second dose of Moderna vaccine (March 2021) and continued into summer. Lost about 1/4 of hair all over head. Regrowth was noticed in August. Joint pain started about the same time and last about 4 weeks. Also spontaneous bruise/bleeding on hands, legs, back, eye- no trauma associated. I have been referred to a hematologist but cannot get in until April. Did not associate symptoms with vaccine until my brother recently had a reaction to the booster and realized that my symptoms fit the same approximate time line (three weeks after).

Write-up: This spontaneous case was reported by an other health care professional and describes the occurrence of PRODUCT TEMPERATURE EXCURSION ISSUE (Temperature Excursion) and EXPIRED PRODUCT ADMINISTERED (one dose was administered after the

second excursion) in a patient of an unknown age and gender who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 068H21A) for COVID-19 vaccination. No Medical History information was reported. On an unknown date, the patient received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. In January 2022, the patient experienced PRODUCT TEMPERATURE EXCURSION ISSUE (Temperature Excursion). On an unknown date, the patient experienced EXPIRED PRODUCT ADMINISTERED (one dose was administered after the second excursion). In January 2022, PRODUCT TEMPERATURE EXCURSION ISSUE (Temperature Excursion) had resolved. At the time of the report, EXPIRED PRODUCT ADMINISTERED (one dose was administered after the second excursion) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. No concomitant medication was provided by the reporter. It was reported that 80 doses Moderna Covid-19 vaccines were exposed to 2 different temperature excursions. First excursion was occurred on 14-Jan-2022 for 30 minutes with maximum temperature (-) 7.8 degrees Celsius and minimum temperature (-) 21.9 degrees Celsius. Second excursion was occurred on 21-Jan-2022 for 15 minutes with maximum temperature (-) 13.2 degrees Celsius and minimum temperature (-) 22.1 degrees Celsius. They had a total of 10 vials on hand. Out of those 10, 2 were moved from the freezer to the refrigerator on 13-Jan-2022 and one was moved on 31-Jan-2022 (total of 3 vials moved to the refrigerator). 3 vials were in the refrigerator and 7 vials were in the freezer. Everything was normal per the HCP and no vaccine state change. 80 total doses from which one dose was already administered to a patient after the second excursion. No previous excursions prior to 14-Jan-2022 and one dose administered after being punctured but the HCP did not know how many doses are still unopened and sealed. No treatment medication was provided by the reporter. Most recent FOLLOW-UP information incorporated above includes: On 09-Feb-2022: Follow-up information received included significant information wherein case became valid as information received about one patient

The reporter is the patient. A 70 year-old female patient received bnt162b2 (COMIRNATY), administered in arm left, administration date 14Feb2021 09:00 (Lot number: EN6201) at the age of 70 years as dose 1, single for covid-19 immunisation. Relevant medical history included: "Factor 5 Leiden" (unspecified if ongoing). There were no concomitant medications. The following information was reported: FLUSHING (non-serious) with onset 14Feb2021, outcome "recovered" (14Feb2021), described as "flushing"; DIZZINESS (non-serious) with onset 14Feb2021, outcome "recovered" (14Feb2021), described as "light headed"; FEELING ABNORMAL (non-serious) with onset 14Feb2021, outcome "recovered" (14Feb2021), described as "felt really spacy for like 2 hours". Additional information: After the first dose, in 5 minutes, she had flushing, was light headed, and felt really spacy for like 2 hours. It went away. No additional vaccines administered on same date of the Pfizer suspect. The patient had no prior Vaccinations (within 4 weeks). No follow-up attempts are possible. No further information is expected.

Write-up: severe stomach pain; Nausea; Vomiting; Fever; Lethargy; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP and Physician). The reporter is the patient. The initial safety information received was reporting only non-serious adverse drug reaction(s). Upon receipt of follow up information on 01Feb2022, this case contains serious adverse reaction(s) and all safety information is processed together. A 8 year-old male patient received bnt162b2 (BNT162B2), intramuscular, administered in arm left, administration date 04Dec2021 13:15 (Lot number: FK5618) at the age of 8 years as dose 2 (tris), single for covid-19 immunisation. The patient had no relevant medical history. There were no concomitant medications. Vaccination history included: Padiatric pfizer (Dose 1, Batch/Lot No: FK5127, Location of injection: Arm Left, Vaccine Administration Time: 04:30 PM, Route of administration: Intramuscular), administration date: 12Nov2021, when the patient was 7 years old, for Covid-19 Immunization. The following information was reported: ABDOMINAL PAIN UPPER (medically significant) with onset 06Dec2021 07:30, outcome "recovered" (Dec2021), described as "severe stomach pain"; LETHARGY (non-serious) with onset 05Dec2021 07:00, outcome "recovered" (06Dec2021), described as "Lethargy"; PYREXIA (non-serious) with onset 05Dec2021 08:00, outcome "recovered" (06Dec2021), described as "Fever"; NAUSEA (non-serious) with onset 06Dec2021 07:30, outcome "recovered" (06Dec2021 13:00), described as "Nausea"; VOMITING (non-serious) with onset 06Dec2021 07:30, outcome "recovered" (06Dec2021 13:00), described as "Vomiting". Therapeutic measures were not taken as a result of lethargy, pyrexia, nausea, vomiting. No other vaccine in four weeks and no other medications in two weeks. The patient did not experienced covid prior vaccination. The morning after second dose of vaccination 05Dec2021 patient had fever starting in the morning (approximately 8:00 AM) continuing through the day until bed time (approximately 8:00 PM), lethargy also started next day 05Dec2021, but continued through late afternoon 2 days following vaccination 06Dec2021. Reporter was not surprised by either of these symptoms as they are pretty common, but the second day after vaccination 06Dec2021, patient woke complaining of severe stomach pain, which was followed by vomiting (around 7:30 AM), constant nausea, and repeated bouts of vomiting, about once every 45 minutes, until about 1:00 PM when both vomiting and nausea stopped. The patient did not test for covid post vaccination. No relevant tests. The reporter consider the Pfizer product had a causal effect to the adverse events. The reporter considered the events lethargy, pyrexia, nausea, vomiting as non-serious. No follow-up attempts are possible. No further information is expected.; Sender''s Comments: Based on available information and a plausible temporal association, the causa association between the event severe stomach pain and the suspect drug BNT162B2 cannot be totally excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated a part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory authorities, Ethics committees, and Investigators, as appropriate.

Write-up: scratchy, slightly itchy sensation at the back of my mouth and upper throat area; scratchy, slightly itchy sensation at the back of my mouth and upper throat area; scratchy, slightly itchy sensation at the back of my mouth and upper throat area; mild tiredness; soreness in the injection area; This is a spontaneous report received from contactable reporter (Consumer or other non HCP). The reporter is the patient. A 61-year-old female patient (not pregnant) received bnt162b2 (BNT162B2), administered in arm right, administration date 08Apr2021 14:15 (Lot number: ER8729) at the age of 61 years as dose 1, single and administered in arm right, administration date 29Apr2021 14:15 (Lot number: ER8736) (at the age of 61-year-old) as dose 2, single for COVID-19 immunisation. Relevant medical history included: "Allergy to metals/ Nickel Sensitivity" (unspecified if ongoing); "Allergy to molds/ Mold/Mildew" (unspecified if ongoing). There were no concomitant medications. Past drug history included: BACTRIM, reaction: "Drug allergy". The following information was reported: ORAL PRURITUS (non-serious), THROAT IRRITATION (non-serious), ORAL DISORDER (non-serious) all with onset 08Apr2021 14:45, outcome "recovered" and all described as "scratchy, slightly itchy sensation at the back of my mouth and upper throat area"; FATIGUE (non-serious) with onset 08Apr2021 14:45, outcome "recovered", described as "mild tiredness"; VACCINATION SITE PAIN (non-serious) with onset 08Apr2021 14:45, outcome "recovered", described as "soreness in the injection area". Therapeutic measures were not taken as a result of oral pruritus, throat irritation, oral disorder, fatigue, vaccination site pain. Additional information: The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient did not receive any medications within two weeks of vaccination. It was reported approximately 20-30 minutes after each dose, the patient experienced a scratchy, slightly itchy sensation at the back of mouth and upper throat area. The patient did not report this symptom at her second vaccine visit- forgot about it actually. After receiving her second dose she knew for sure that it was related, though after her first dose she had strong conclusion. She would equate the feeling as "like coming down with something." In both cases, the feeling was mild and lasted five to six hours. Of note, she was a Respiratory Therapist, but not currently practicing- she had been unemployed since a few months before COVID-19. Other than that she only experienced mild tiredness and soreness in the injection area that went away within a couple days. Event onset date was reported as 08Apr2021 at 14:45. Since the vaccination, the patient had not been tested for COVID-19. No follow-up attempts are possible. No further information is expected.

Write-up: 3 weeks post vaccine moderate to severe bilateral knee pain that got worse in the night. Then the addition of overall boy aches (feel like flu body aches) all over, several times a week, incapacitating me. Went to primary doc, got PT for my knees, saw orthopedic, got MRI, minor arthritis and tendinopathy. No one knew why I was feeling so awful. Referral to Rheumatology but appointment couldn''t get in until Nov. Bloodwork done and blood levels abnormal. Referred to Hematology/Oncology. Bone marrow biospy 1/6/22 and diagnosed with Kappa Light Chain Multiple Myeloma

Other Medications: I was taking Gabapentin for Nerve pain and Ritalin when I was given a Tetanus Booster shot. Td Adult Sanofi Pasteur 2/15/2001. At the time of vaccination I had bee infected with Lyme and Babesia back in June of 1999. I would not test pos
Current Illness: LYME AND BABESIA DUNCANI THAT I CONTRACTED IN JUNE OF 1999. THE MEDICAL SYSTEM COULD NOT FIGURE OUT THE CAUSE OF MY PAIN (ADVERSE EVENT) i was fired by my local doctor in September of 2010 because I could not manage my pain meds. I had failed surgery for my neck pain/. I was given a cervical disectomy with fusion from C3-C5. all of my pain was from the tetanus booster I was given almost two years after contracting Lyme Disease in 1999.
Preexisting Conditions: ASTHMA
Allergies: SULFUR
Diagnostic Lab Data: I have an extensive MEDICAL record documenting all of my pain and tests
CDC Split Type:
Write-up: I was a Sales Representative who contracted Lyme and Babesia in June of 1999. I never saw a tick but after my long recovery I remember a bite on the back of my scalp. After receiving the Sanofi Paster Td vaccine on February 15, 2001 I came down with back pain and neck pain within 7 days. I have been on chronic pain medication ever since. Initially I went to chiropractors and it was my chiropractor who referred me back to my Doctor for Xrays and MRI''s and the like. I was rapidally deteriorating while the Medical System denied that I had Lyme Disease for 15 years until I finally tested positive in December of 2013 for Lyme and Babesia Duncani.

Write-up: Patient assented and mother consented to a COVID booster shot. After shot was given, patient revealed his COVID vaccination card that already noted completion of his primary series + COVID booster (3rd shot). Our office only had record of completion of the primary series. He got his booster somewhere else, we didn''t have documentation ahead of time supporting that. Discussed with patient and his mother the error & apologized. We encouraged monitoring for any routine signs/symptoms that can be experienced after the mRNA vaccine but don''t anticipate any other sequelae or side effects.

Write-up: After Thanksgiving, my right arm started to break out in a rash. It gives bumps just like Shingles. I had the shingles vaccine before Thanksgiving. I had a total of 5 shots for different things. I think it is because of constantly washing and the gloves I use for work. My doctor has been taking tests as needed. My cholesterol was high but I do not think it has anything to do with my arm. I also went to a dermatologist last year. I have another appointment on May with my doctor. My doctor gave me some cream for my arm. It seems to be helping. I still have the rash and I am hoping to get better soon with time.

Preexisting Conditions: Rheumatoid Arthritis -Spondylarthropathy Irritable Bowel Syndrome Gastroesophogeal Reflux Disease Sliding Hiatal Hernia Polycystic Ovarian Disorder Heart Murmur Eczema Thyroid Disease (non-specific)
Allergies: Medications - none known - Food - no life threatening allergies, many intolerances causing gastric distress or mild reaction (itching, diarrhea), the worst of which are: garlic, onion, peaches, apples, asparagus, and gluten containing foods - Environmental - not life threatening: dust, perfumes, pollen, mold, mildew cause sneezing, coughing, itching, runny nose/eyes, congestion - Skin - very sensitive, will break out in contact dermatitis from lots of adhesives and regular topicals.
Diagnostic Lab Data:
CDC Split Type:
Write-up: Swollen lymph node and swelling in left armpit (same side as the shot was given). Was examined by a doctor at PCP clinic 2 days after symptoms were first noticed, at that time lymph node swelling described as walnut-sized. Said it may take a couple of weeks to completely resolve or come back in for a re-check.

Preexisting Conditions: none
Allergies: none
Diagnostic Lab Data: On 3/7/2022, I received a physical examination, and x-rays of the right shoulder joint were taken. The medical professionals concluded I''m experiencing adhesive capsulitis of the right shoulder. My current symptoms are emblematic of the "frozen" stage of the condition. The time period of late-June, to early-March, was likely the "freezing" stage of the condition. Without explanation, the shoulder joint froze very rapidly, and is very painful.
CDC Split Type:
Write-up: The injection was quite painful when the needle went in the right arm muscle near the shoulder. The next day the range of motion in the right shoulder joint became slightly limited due to pain. These symptoms persisted for 8 months, at which time, in early-March, the pain became severe all of a sudden, and resulted in no range of motion in the right shoulder joint due to pain and stiffness. At which time, I sought medical treatment.

Write-up: Pain in liver area after each injection; I have cyst that is 5.7 cm in size and now is causing increased pain since getting injections; This is a spontaneous report received from contactable reporter(s) (Other HCP). The reporter is the patient. A 55 year-old female patient (not pregnant) received bnt162b2 (BNT162B2), administered in arm right, administration date 03Oct2021 (Lot number: 30155BA) at the age of 55 years as dose 3 (booster), single for covid-19

immunisation. Relevant medical history included: "migraines" (unspecified if ongoing); "epilepsy" (unspecified if ongoing); "known allergies: eggs" (unspecified if ongoing); "seizure", start date: 1986 (unspecified if ongoing). Concomitant medication(s) included: TOPAMAX. Past drug history included: Novocaine, reaction(s): "known allergies: Novocaine"; Lidocaine, reaction(s): "known allergies: Lidocaine"; Celebrex, reaction(s): "known allergies: celebrex". Vaccination history included: Bnt162b2 (dose 1, single, product= COVID 19, brand= Pfizer, lot number= EL1284, administration date= 06Jan2020,, vaccine location= Left arm), administration date: 06Jan2021, when the patient was 54 years old, for COVID-19 immunization; Bnt162b2 (dose 2, single, product= COVID 19, brand= Pfizer, lot number= EL9261, administration date= 27Jan2021, vaccine location= Left arm), administration date: 27Jan2021, when the patient was 54 years old, for COVID-19 immunization. The following information was reported: HEPATIC PAIN (non-serious) with onset 03Oct2021, outcome "recovered with sequelae", described as "Pain in liver area after each injection"; CYST (non-serious) with onset 03Oct2021, outcome "recovered with sequelae", described as "I have cyst that is 5.7 cm in size and now is causing increased pain since getting injections". Therapeutic measures were taken as a result of hepatic pain, cyst. Additional information: Facility type vaccine was reported as Pharmacy or Drug Store. Patient had not received any other vaccines within 4 weeks before COVID vaccine and patient was not diagnosed with COVID-19 prior or post vaccination. Pain in liver area after each injection. She had cyst that was 5.7 cm in size and now was causing increased pain since getting injections. She had thought it was an inflammatory response until she sought treatment for pain and weight loss. She was reporting as she did not correlate until after her most recent injection as her symptoms were resolved and within hours of injection pain resurfaced in liver area. The patient recovered with lasting effects. No follow-up attempts are possible. No further information is expected.

CDC Split Type:
Write-up: She got her vaccine, had injection site pain starting at 12:30 AM. Her wrist hurt alot but was not concerned about that. She woke up at 12:30 with right leg cramping like a Charley horse from her hip to her foot and could not release it. It was very, very tight and in a spasm. That lasted many hours. She went back to bed, and when she woke up again around 5:30 or 6:00 her leg was still somewhat cramped, but her calves were completely twitching and tiny muscle spasms, and she would say hundreds to thousands of them going off all the time, tiny muscle spasms. Since then she has been left with this problem in her calves specifically, but also all over her entire body including her cheeks, thighs, stomach, buttocks all day every day. It seems to lessen at times, but comes back, worse at rest and did not have any issues like this before the vaccine. It is mainly generalized in her calves. She has seen a doctor and her doctor did not give her anything to treat the condition. She has just been dealing with it on her own pretty much.

Preexisting Conditions: Asthma, seasonal bronchitis.
Allergies: Oxycodone.
Diagnostic Lab Data: Chest x-ray.
CDC Split Type:
Write-up: She got her vaccine, did not know it was Pfizer, thought it was J&J. Was in the lobby where she lives, lady was behind her and did not say anything to her, got her the shot in her right arm, then looked at her vaccine card and saw that it was Pfizer and informed her that J&J did not have a booster. She did not feel anything, a little bee sting feeling. Then on 1/6/22 she started coughing and started getting sick. She saw the nurse at Health Clinic and they told her lungs were clear. She did not feel comfortable with the booster shot. She had a cough in January and it has progressively gotten worse. She has a stabbing type of discomfort in her left lung. She saw the doctor at the clinic (who she saw twice), also had a teledoc call, and said that if it wasn''t for the booster shot she would probably be in the hospital due to her asthma. The cough went away and then it comes right back. She is coughing up clear, bubbly shot. She did have a chest x-ray after seeing Dr. and her lung x-ray was normal, which she was informed yesterday. Was given codeine cough syrup, getting blood in her sputum and got those results yesterday. She was told not to go out in the cold weather, but the nurses told her that it was OK. She was prescribed Benzonatate for her cough, also takes her inhalers as needed Singular and Ventolin inhalers as needed. The medicine does not seem to be helping and the inhalers don''t seem to be working either, neither is the codeine and still wakes up in the middle of the night coughing, does not get sleep and wakes up her boyfriend from coughing so much. It''s a dry cough, different from her usual bronchitis type symptoms that she has. They feel that it is her anxiety overworking her, but says she knows her body and it does not feel right. It''s now been 3 weeks for this flare up and has not subsided. She coughs so much she coughs up her medicines and her food. They told her that they feel that she had viral bronchitis with a cough.

Diagnostic Lab Data: 02/15/2022 Allergy Needle Testing and everything came back: normal
CDC Split Type: vsafe
Write-up: About two weeks after the vaccine, I noticed at dinner I was not able to taste or smell my food. I have no taste no smell. I"ve also have started to have a heavy chest. Started taking Claritin, Flonase, saline flushes and nothing helped. In 12/2021, I had a tele visit with my doctor. She asked if I tested for COVID and I told her I had and was negative. When I blow my nose its only clear. I am not congested. I called my doctor and she sent me to an allergy specialist. 02/15/2022, I have my appointment with the allergist. They performed an Allergy Needle Test and everything came back: normal. They are setting up a cat scan in 04/21/2022 to see if I have any polyps. They advised I should take Nasacort and I"ve been taking two sprays in the AM and two sprays in the PM.

Write-up: Have edema in his throat/Have swelling his throat; Have edema in his esophagus/Have swelling esophagus; he has not been able to eat or drink normally; Not been able to eat or drink normally has lost 40 pound; Developed a welt at the injection site the size of a baseball; Feeling very nauseous; Feeling sick; This case was reported by a consumer via call center representative and described the occurrence of injection site wheal in a 60-year-old male patient who received Herpes zoster (Shingrix) (batch number 3454N, expiry date 23rd August 2022) for prophylaxis. Concurrent medical conditions included tooth infection. Concomitant products included amoxicillin + clavulanic acid (Augmentin). On 2nd August 2021, the patient received the 1st dose of Shingrix (intramuscular) .5 ml. On 2nd August 2021, immediately after receiving Shingrix, the patient experienced injection site wheal, nausea and feeling unwell. In August 2021, the patient experienced throat edema, esophageal edema, swallowing difficult and weight loss. On an unknown date, the outcome of the injection site wheal, nausea and feeling unwell were recovered/resolved and the outcome of the throat edema and esophageal edema were not recovered/not resolved and the outcome of the swallowing difficult and weight loss were unknown. It was unknown if the reporter considered the injection site wheal, nausea, feeling unwell, throat edema, esophageal edema, swallowing difficult and weight loss to be related to Shingrix. Additional details were provided as follows: The case was reported by the patient. The patient received Shingrix in his left arm. Soon after receiving the injection, he reported feeling very nauseous and sick, and he developed a welt at the injection site the size of a baseball. These symptoms last 3 days before resolving. The reporter then stated that about one week after the vaccine, he began to had swelling and edema in his throat and esophagus and described his throat as a riverbed of rocks. He stated he had not been able to eat or drink normally since then and has lost 40 pounds. The patient had an appointment for a GI (gastro-intestinal) exam later this week. The reporter stated at the time of the Shingrix vaccine he was also suffering from a tooth infection and was being treated with the antibiotic Augmentin. The patient reported the swelling of his throat and esophagus were the worst from the months of October through December and are still unresolved. The patient stated that he would not be taking the second dose of Shingrix due to the adverse events experienced. The reporter consented to follow up.

CDC Split Type: USPFIZER INC202200440566
Write-up: This is a spontaneous report received from a contactable reporter(s) (Consumer or other non-HCP). The reporter is the patient. A 93-year-old female patient received bnt162b2 (BNT162B2), administered in arm right, administration date 09Oct2021 (Lot number: FF8841) at the age of 92 years as dose 3 (booster), single for covid-19 immunisation. The patient''s relevant medical history was not reported. Concomitant medication(s) included: ELIQUIS taken for anticoagulant therapy; ZYRTEC [CETIRIZINE HYDROCHLORIDE]; BENADRYL; TYLENOL; PREDNISONE taken for rash. Vaccination history included: Bnt162b2 (Her first vaccine was on 23Jan2021, with lot number EN5318., Her first two vaccines were given in her left arm), administration date: 23Jan2021, when the patient was 91 years old, for Covid-19 immunization; Bnt162b2 (Her second vaccine was on 13Feb2021 with lot number EN5318., Her first two vaccines were given in her left arm), administration date: 13Feb2021, when the patient was 91 years old, for Covid-19 immunization. The following information was reported: INSOMNIA (non-serious), outcome "unknown", described as "she hasn''t been able to sleep at night"; PRURITUS (non-serious), outcome "not recovered", described as "body itching"; RASH (non-serious), outcome "not recovered", described as "rash all over her upper body, including her arms, back, and stomach"; INJECTION SITE HAEMATOMA (non-serious), outcome "recovered", described as "Her arm had a big hematoma where she had the shot in her right arm.". The events "body itching" and "rash all over her upper body, including her arms, back, and stomach" were evaluated at the physician office visit. Relevant laboratory tests and procedures are available in the appropriate section. Additional information: Patient received 3 doses of the COVID shots. She doesn''t had a prescribing doctor. It has been five months now, and she hadn''t been able to sleep at night. She had been experiencing body itching and a rash all over her upper body, including her arms, back, and stomach. She had been to a Dermatologist 5 times, and nobody can say what it was. She had tried antihistamine, steroid ointments, and prednisone, and none of them worked for her rash. Right after her booster shot, four days later, she developed COVID arm. Her arm had a big hematoma where she had the shot in her right arm. She had recovered completely from that. Her first two vaccines were given in her left arm. The rash started about two weeks after the booster. It started with itching skin and then broke out from there. She got her first two vaccines in her senior complex. For a year and a half she had been on Eliquis a blood thinner. She takes 2.5mg in

morning and 2.5mg at night. She had tried taking Zyrtec, Benadryl, and Tylenol. She doesn''t know what else. She checks her medicines regularly. Patient visit dermatologist and primary Physician Office. Patient did not visit Emergency Room. Patient did not taken prior Vaccinations (within 4 weeks). Patient medical history (including any illness at time of vaccination): provide other relevant medical history including but not limited to these conditions: diagnosed allergies, compromised immune status, respiratory illness, genetic/chromosomal abnormalities, endocrine abnormalities (including diabetes) and obesity: no. Relevant Tests: List other relevant diagnostic and confirmatory test results for event(s), for example, from blood tests, cerebrospinal fluid culture, bacterial sero-type, diagnostic imaging, (e.g., chest X-ray, MRI). Description of complaint: She has tried antihistamine, steroid ointments, and prednisone, and none of them worked for her rash. She doesn''t have the NDC/lot/expiration for those products. She knows she has tried Zyrtec, Benadryl, and Tylenol, but doesn''t know what else right now. Is a sample of the product available to be returned, if requested (Y/N): Yes, caller was informed of a prepaid mailer in 3-10 business days. No follow-up attempts are possible. No further information is expected.

Current Illness: No illnesses.
Preexisting Conditions: Multiple Myeloma, Bladder Cancer. I have two stents also.
Allergies: Food allergies: fish, green beans, blue crab, and intolerance to some additives. Polysorbates, Soy, Sulfa, Yellow Dye, Latex, Natural Rubber, Adhesive. Meds: Ciprofloxacin, Amoxicillin, Cephalexin, Decadron, Diazepam, Dicyclomine, Erythromycin, Nexium, Terconazole. Mostly from the additives to medicines.
Diagnostic Lab Data: None
CDC Split Type:
Write-up: Soon after the shot, while waiting the 15 minutes, my face from my chin to my eyebrows felt very warm. Like it was getting red and numb. I sat very still and did not panic. I took a Claritin while waiting. The pharmacist who gave the shot had gone back to work. At the end of 15 minutes I received my paperwork and left the pharmacy. I was not checked on or asked if everything was OK. I went home and sat quietly for the evening. The sensation wore off about 5 1/2 hours later. I took another Claritin before bed. When I had received the previous 2 shots I did not have any concerning reactions. They had been given by pharmacy - EN5318 & EN6199 in right arm.

Write-up: I met with the family to administer 2nd vaccine to son , on 3/15/22. Via interpreter and from the father and the son, I was told that his other son was about to turn 12 and he really needed the vaccine today as they didn''t know when they might be able to get it if they didn''t get it now. The father and the child, both gave a DOB and said he was going to be 12. Due to the circumstances and the urgency from father I administered the first Pfizer vaccine. Today I went back to give the 2nd shot and the interpreter that was interpreting said the child''s birthday year was and the child had just turned 11. The father continued to insist the child was 12....Advised the father that the child received the wrong dose of vaccine and for his 2nd vaccine needs to get the appropriate Pfizer vaccine for children 12 and under. The child had no adverse side effects other than a sore arm. Father expressed understanding and a plan was made to administer the appropriate dose of vaccine in the future.

Write-up: Patient received expired dose after manufacturer date of expiry; This spontaneous case was reported by a nurse and describes the occurrence of EXPIRED PRODUCT ADMINISTERED (Patient received expired dose after manufacturer date of expiry) in a male patient of an unknown age who received mRNA-1273 (Spikevax) (batch no. 067H21A) for COVID-19 vaccination. No Medical History information was reported. On 04-Apr-2022, the patient received dose of mRNA-1273 (Spikevax) (Intramuscular) 1 dosage form. On 04-Apr-2022, the patient experienced EXPIRED PRODUCT ADMINISTERED (Patient received expired dose after manufacturer date of expiry). At the time of the report, EXPIRED PRODUCT ADMINISTERED (Patient received expired dose after manufacturer date of expiry) outcome was unknown. For mRNA-1273 (Spikevax) (Intramuscular), the reporter did not provide any causality assessments. Concomitant medication information was not provided by the reporter. It was reported that the vial was stored in the refrigerator on 05-Mar-2022. Vial did not undergo any temperature excursions. Treatment information was not provided by the reporter. This case was linked to MOD-2022-532744, MOD-2022-532663, MOD-2022-532745 (Patient Link).

CDC Split Type:
Write-up: I may have misunderstood the last question. The vaccine was administered at a pharmacy. I experienced left arm pain which resolved. I also experienced pain in my chest wall/ribs/sternum on the left, as well as breast tenderness in the left. Initially, the pain woke me up at night. Although that went away, I stopped wearing a standard bra and am wearing a bra with less support. The pain has persisted. It seemed to flare a bit when I had the third Pfizer vaccination on 10/04/2021. The condition is an annoyance at times but has not changed my relatively active lifestyle.

Current Illness: A-Fib, mild asthma, high cholesterol
Preexisting Conditions: mitral valve prolapse, high cholesterol, last three years A-Fib.
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: About 11 pm my armpit became sore and grew increasingly so until to move it was painful. Upon inspection the following morning there was a nickel-sized black and blue mark and some yellow discoloration beneath that of an area about four inches by 5 inches to the side of the breast. The black and blue marks continued to appear over the next several days. The pain lasted for three days before subsiding enough so that it was not painful to move. My GP was consulted on day 5 and confirmed the lymph nodes were swollen and painful upon applying pressure.

Write-up: I had my booster on 11/9/2021 and had headache and fever for a couple of days afterward. Then on 11/15/2021 it started to get worse. The headache turned into a migraine, and I started having joint, muscle and nerve pain along with cramping and sciatica pain. It got to where I could barely move without being in pain, and I could barely drive. The pain never did ease up. All my joints are inflamed and above a 10 on a pain scale. Until this happened, I didn''t menstruate for 10 months, then all of a sudden started having heavy discharge. It''s not blood, like a regular period would be, it''s like a light pink and brownish color with yellow mixed in sometimes. The clinic told me it sounded like my uterine line was shedding. But I haven''t been able to confirm anything. I started to have IBS problems as well. I started to have acid reflux and was barely able to stomach anything. I decided to try intermittent fasting to help reset my digestion. I''ve occasionally tried this in the past and I''ve always felt like it helped me. This time I did it for almost a month and gradually started bringing soft bland food into my diet. Still working through migraines and sciatica and having joint pain, it''s like having "charley horses" in different parts of my body daily. My doctor advised me to have an MRI, but I don''t have the money or anyone to take me as I still can''t safely drive very well.

Write-up: I came back from vacation and thought I had allergies. I was unable to smell the day after I got home. I tested a few days later. On day five is when I started having trouble with my breathing. I spent about a week in bed and had a ton of SOB. I was weak and my body was aching. I also had my heart rate go up and it was constantly racing. This led me to get testing because this heart racing continued beyond my other symptoms resolved.

Previous Vaccinations: Flu Shot September 2019. My arm hurt really bad and I still have pain at the Injection site.
Other Medications: Atorvastatin 10MG once daily at night; ibuprofen PRN; EmergenC vitamin C vitamin drink.
Current Illness: None.
Preexisting Conditions: BP 140/72 Hypertension.
Allergies: Albuterol; several medicines I have been given medications for hypotension such as lisinopril; losartan; hydrochlorothiazide; I am not sure of others but these type medications made my legs swell and my skin peeled.
Diagnostic Lab Data: None.
CDC Split Type: vsafe
Write-up: On 03/12/2021 at 11:00AM I woke up and went into work. I work for a doctors office. I was having very tight neck pain, aches, muscles and tendons feeling like they were coming out of my skull and so tight. I could not turn my head left or right. This pain went down into my top of my head down to my shoulders. I went and made an appointment with a Chiropractor for the 03/16/2022 for first treatment and returned for 03/18/2021 and 03/26/2021. It did not help so then I went to my PCP on 04/15/2021. I started Physical Therapy on the 19th @ 02:15 at the local office. It was the beginning of relief. I was given deep tissue massage and some stretches to do. I went back on 04/26/2021, 04/29/2021, 05/03/2021, 05/06/2021, and the 05/13/2021. Was my last twice weekly appointment. She did get things loosened. I went back on 05/26/2021, 06/02/2021, 06/16/2021 for my final PT appointment. I just took OTL ibuprofen.

CDC Split Type: vsafe
Write-up: I had body aches, a fever, and a headache for about 3 hours for 2 afternoons in a row. Then I tested positive for COVID-19. The next morning, I got the monoclonal antibody infusion which caused a reaction. Within 3 minutes of receiving, it I started getting a warm feeling in my belly. Something went up my body, and I couldn''t breathe. I got really hot and really red. Then I

ended up in the emergency room. My heart felt weird. I had a little bit of tightness in my chest. After I had recovered from COVID-19 I had cramping in my hands. My arthritis has gotten significantly worse too.

CDC Split Type: vsafe
Write-up: Adverse event began about 3 to 4 after the 3rd dose of Moderna. I started having hives on various parts of my body, It was more prevalent when anything touched my skin. One day it flared up to almost 60% to 70% of my torso. It was where ever I scratched, it was very itchy. There were red raised welts where ever I scratched or had something touched my skin. It went on, after the first day my PCP had given me Pridinol, I went back in a week and was given prednisone. He was also having me taking Benadryl at night, which really did not help diminish the effects really. After a while he suggested that I take Zyrtec twice per day and that calmed it down quite a bit, that actually helped me sleep. That did not stop the flair up, but made it less itchy. I have been taking Zyrtec 10mg since about February. I have tried to stop taking the allergy medication, but it has flared up today. I would prefer to not have to take any medication any more. I saw a dermatologist confirmed that this was happening with Moderna boosters. The diagnosis was skin dermatographias.

CDC Split Type:
Write-up: Vaccine booster given on 11/1/2021. Muscle aching noted the next day. The days following I began to become winded doing things as simple as normal walking. The feeling of being winded continued and worsened by the day until I went to the Emergency Room during the early morning hours of 11/9/2021. I was transferred by ambulance from there to the Medical Center in Emergency Room to see cardiology. I had flown from 11/4 to 11/8. I was diagnosed by cardiology as having pericarditis. I was sent to the cardiac cath lab to remove the fluid. 1075 cc"s of fluid was removed from my heart. My cardiologist said that my heart had gone into cardiac tamponade during the procedure. I was moved to the ICU after the procedure and then discharged home the next day. I was placed on preventative meds on discharge. In follow-up chest imaging, it was determined that I also had a small pulmonary embolus that showed in my right lung. The cardiologist said it appeared to be older and likely from when the pericarditis was.

Current Illness: Blood pressure; Depression; Focal epilepsy; Food allergy
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20225
Write-up: after the first booster they also got a big seizure companion could not understand what she was saying; This spontaneous case was reported by a consumer and describes the occurrence of SEIZURE (after the first booster they also got a big seizure companion could not understand what she was saying) in a 77-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 939903) for COVID-19 vaccination. Concurrent medical conditions included Food allergy, Blood pressure, Focal epilepsy and Depression. Concomitant products included CITALOPRAM (CELEXA) for Depression, LACOSAMIDE (VIMPAT) for Seizure. On 29-Oct-2021, the patient received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 29-Oct-2021, the patient experienced SEIZURE (after the first booster they also got a big seizure companion could not understand what she was saying) (seriousness criterion medically significant). At the time of the report, SEIZURE (after the first booster they also got a big seizure companion could not understand what she was saying) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Concomitant medications included unspecified seizure medication and blood pressure medication. Patient dosage text reported as First booster dose. The patient never had COVID positive test or diagnosis. The patient did not receive any other vaccines within 1 month prior to Moderna COVID-19 vaccine. Adverse event cause patient to seek medical care. Patient experienced a similar event in the past. The patients symptoms were improved. It was stated that the patient had no reactions to any of the other doses, but now had a sore arm around the injection site and was not so bad, and that after the first booster the patient also got a big seizure, and her companion could not understand what she was saying and that the patient was extraordinary dizzy until this day. Company comment: This is a spontaneous case concerning a 77-year-old, female patient with no reported medical history and with relevant concomitant medications of Lacosamide (Vimpat) and Citalopram (Celexa) and vaccine history of receiving first and second dose of mRNA-1273 vaccine, who experienced the unexpected serious (medically significant) AESI event of seizure. The event occurred the same day after the first booster dose of mRNA-1273 vaccine administration. The relevant concomitant medications of Lacosamide (Vimpat) and Citalopram (Celexa) remain confounders for the event seizure. The outcome of the event was unknown. The benefit-risk relationship of mRNA-1273 vaccine is not affected by this report. This case was linked to MOD-2022-548597 (Patient Link).; Sender''s Comments: This is a spontaneous case concerning a 77-year-old, female patient with no reported medical history and with relevant concomitant medications of Lacosamide (Vimpat) and

Citalopram (Celexa) and vaccine history of receiving first and second dose of mRNA-1273 vaccine, who experienced the unexpected serious (medically significant) AESI event of seizure. The event occurred the same day after the first booster dose of mRNA-1273 vaccine administration. The relevant concomitant medications of Lacosamide (Vimpat) and Citalopram (Celexa) remain confounders for the event seizure. The outcome of the event was unknown. The benefit-risk relationship of mRNA-1273 vaccine is not affected by this report.

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20225
Write-up: This spontaneous case was reported by a consumer and describes the occurrence of SEIZURE (told the ushers that they were having a seizure/ knew they were having a seizure) in a 77-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 001M21A, 013M20A, 012A21A and 939903) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Food allergy (Turmeric), Focal epilepsy, Blood pressure abnormal (blood pressure medication) and Depressive disorder (antidepressants Celexa). Concomitant products included CITALOPRAM HYDROBROMIDE (CELEXA [CITALOPRAM HYDROBROMIDE]) for Depression, LACOSAMIDE (VIMPAT) for an unknown indication. On 03-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (Intramuscular) 1 dosage form. On 03-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 29-Oct-2021, received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 22-Apr-2022, received fourth dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. In April 2022, the patient experienced VACCINATION SITE PAIN (haves a sore arm around the injection site and is not so bad). On 23-Apr-2022, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced SEIZURE (told the ushers that they were having a seizure/ knew they were having a seizure) (seriousness criterion medically significant). On 24-Apr-2022, the patient experienced HYPERSOMNIA (slept all day). At the time of the report, SEIZURE (told the ushers that they were having a seizure/ knew they were having a seizure) was resolving and HYPERSOMNIA (slept all day) and VACCINATION SITE PAIN (haves a sore arm around the injection site and is not so bad) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Concomitant medications included unspecified seizure medication and blood pressure medication.

It was reported that, 24 hours after getting the second booster the patient got diarrhea but was not sure, had to use the toilet a few times, and on the theater had to go up some stairs, and felt dizzy, and was not firm on the steps, and told the ushers that patient had a seizure. Also was very dizzy going up the stairs. Patient knew she had a seizure, but did not remember off been in the ambulance, going to the hospital, been put in IV, or been admit in the hospital for a couple hours. It was stated that she had no reactions to any of the other doses, but now had a sore arm around the injection site and was not so bad, and that after the first booster she also got a big seizure and there companion could not understand what she was saying and she was extraordinary dizzy until that day, and that they slept all day. The patient never had COVID positive test or diagnosis. The patient did not receive any other vaccines within 1 month prior to Moderna COVID-19 vaccine. Adverse event cause patient to seek medical care. Patient experienced a similar event in the past. Patient''s symptoms were improved. No treatment medication was reported. Company comment: This spontaneous case concerns an 77-year-old female patient with underlying medical history Focal epilepsy, blood pressure abnormal and depressive disorder who experienced the unexpected, serious (medically significant) AESI of Seizure and unexpected, non-serious AESI of hypersomnia. The event Seizure occurred 1 day after receiving a dose of mRNA1273 and Hypersomnia started 2 days after administration of mRNA1273 as fourth dose of COVID-19 vaccine. The events may be in association with each other. The patient had seizure and was having trouble remembering the events that happened thereafter, persistence of dizziness was also noted. The clinical course and treatment details were not stated in the case. The patient''s advanced age and underlying medical history of Focal epilepsy, blood pressure abnormal and depressive disorder may be considered as risk factors to the event Seizure and Hypersomnia and remain as confounders in this case. The benefit-risk relationship of mRNA-1273 is not affected by this report. This case was linked to MOD-2022-548571 (Patient Link). Sender''s Comments: This spontaneous case concerns an 77-year-old female patient with underlying medical history Focal epilepsy, blood pressure abnormal and depressive disorder who experienced the unexpected, serious (medically significant) AESI of Seizure and unexpected, non-serious AESI of hypersomnia. The event Seizure occurred 1 day after receiving a dose of mRNA1273 and Hypersomnia started 2 days after administration of mRNA1273 as fourth dose of COVID-19 vaccine. The events may be in association with each other. The patient had seizure and was having trouble remembering the events that happened thereafter, persistence of dizziness was also noted. The clinical course and treatment details were not stated in the case. The patient''s advanced age and underlying medical history of Focal epilepsy, blood pressure abnormal and depressive disorder may be considered as risk factors to the event Seizure and Hypersomnia and remain as confounders in this case. The benefit-risk relationship of mRNA-1273 is not affected by this report.

Write-up: Patient had received an expired COVID 19 vaccine. Vaccine was drawn up on 4/21/22 at 12:00pm for a patient & the vial was put back into the refrigerator. At the end of the day, vial wasn''t wasted & it also wasn''t dated. Next day around 1630, pt received his 1st dosage of COVID 19 as ordered by Dr. Staff then realized that the vial wasn''t labeled & it was from 4/21/22. Dr. called the parents up on 4/21/22 to check on patient at the end of the day. Parents stated that pt was fine. No symptoms noted. Patient was brought back to the office on 5/2/2022 to received a dose of COVID 19.

CDC Split Type: USPFIZER INC202200636361
Write-up: This is a spontaneous report received from contactable reporter(s) (Other HCP). The reporter is the patient. A 40-year-old female patient (not pregnant) received BNT162b2 (BNT162B2), on 21Dec2021 as dose 3 (booster), single (Batch/Lot number: unknown) at the age of 40 years for covid-19 immunisation; COVID-19 Vaccine - Manufacturer Unknown, as dose 1, single (Batch/Lot number: unknown) and as dose 2, single (Batch/Lot number: unknown) for covid-19 immunisation. The patient''s relevant medical history included: "Idiopathic Intercranial Hypertension" (unspecified if ongoing); "Factor V Leiden mutation" (unspecified if ongoing), notes: other medical history: Factor 5 Leiden. Known allergies: No. Other medication in 2weeks product concomitant medication(s) included: VIT D [COLECALCIFEROL]; CETRIZINE; FLONASE ALLERGY RELIEF. The following information was reported: DRUG INEFFECTIVE (medically significant) with onset 20Apr2022, outcome "unknown", COVID-19 (medically significant) with onset 20Apr2022, outcome "not recovered" and all described as "Covid-19". The patient underwent the following laboratory tests and procedures: Test: (Apr2022) high viral load; SARS-CoV-2 test: (12Apr2022) Negative, notes: Tested negative, 12Apr & 16Apr on at home test; (Apr2022) Positive, notes: Symptoms started back up 20Apr2022 and then tested positive on at home test; (16Apr2022) Negative, notes: Tested negative. April 12Apr & 16Apr on at home test. Therapeutic measures were taken as a result of covid-19. It was reported that, Anti viral details: product=COVID-19 Treatment, Brand= Paxlovid, Treatment start date=06Apr2022,, Treatment stop date=11Apr2022, Indication=Treatment of COVID-19. Patient Had a reinfection 8 days after ending treatment of Paxlovid. Tested negative 12Apr & 16Apr on at home test. Symptoms started back up 20Apr and then tested positive on at home test. Local Hospital did a test and found high viral load, said more than likely was infected. Adverse event start date: 20Apr2022. Patient recovered: Recovered. Treatment ae: No. The information on the batch/lot number for BNT162b2

has been requested and will be submitted if and when received.

Write-up: after fist shot had racing heart for about 2 days and increased anxiety. a little headache. After the 2nd shot i had a headache and was a little tired. I continued to develop sinus and eye problems in the next few weeks with sinus and eye pressure. I was treated with an antibiotic for a sinus infection. 3 months after my 2 nd shot I developed severe and debilitating vertigo with neck pain and vomiting and a headache. It took about 6 months for the vertigo to go away. I started having more neck and shoulder pain along with some chest pain over the year but thought it was from exercise. I was just diagnosed with pleurisy with effusion and pericarditis. I very strongly feel the connection with the vaccine and my recent diagnoses. I am sensitive to most medicines and this one is just another. I have also developed lung nodules that were not there until I got the vaccine.

Diagnostic Lab Data: COVID test (03/30/2022): Positive
CDC Split Type: vsafe
Write-up: On 03/30/2022, I tested positive for COVID and was asymptomatic at that time. I was prescribed Paxlovid to take for 5 days and was told to isolate for 5 days (but I isolated for 8). During that period, I had elevated temperature (2 degrees higher than normal for 2 days), a cough and a sore throat for about 4-5 days. I had general flu like symptoms and was overall achy. The only odd symptom I had was a metallic taste on my tongue for about 8 days but I contributed that to the antiviral. I was told to mask for 10 days which I did and steill continue to mask. Now I feel fine.

Write-up: I had sneezing and coughing and felt like a bad head cold, I had the flu feeling, sore throat and lots of congestion. I saw the doctor the day after I tested positive, I home tested on Sunday and called my doctors office right away and got the medication for the Paxlovid. It got really severe but I think it would have been more severe and longer without the Paxlovid. Someone in the house hold had symptoms a couple days a heard of me and got COVID-19, so I assume I got it from her.

CDC Split Type:
Write-up: She got her vaccine, had immediate pain and swelling, had fever, and had a hard lump under her skin like a large strawberry and itchiness, lots of it. The hard lump has somewhat subsided. At the injection site the area has grown and it is the size of a fingernail now. It is red, lump is smaller, but is still present and itchy. She has not taken anything for it, and has not gone to her doctor. She has sent a photo and a message and waiting for that response. Had tetanus vaccine at the same time in the same arm. Says the wound itself looks like a flesh eating thing that is a bizarre wound. She has had shingles in the past, about 10 years ago and asked the nurse at the time if it mattered if she had had shingles in the paste or not, and she was informed that it did not. This area is now a wound not just an injection site, it did scab over and it''s below skin level and is now a crater. The scab will fall off, and the itching is intense so she may be scratching it in the night. She got her 4th vaccine a week ago and had a fever, chills which is how she felt after the shingle shot as well, but no other reactions.

Write-up: A couple of days after the vaccine I felt very sick and extreme fatigue as well as pressure on my chest like tachycardia. I called my doctor on 4/5/22 and was told it''s probably because I got my vaccine too early after getting Covid in January. I went to the doctor again 3 weeks later due to extreme tachycardia. They ordered a halter monitor. On 4/28 I went to the the ER due to extreme tachycardia again. All tests came back clear. I wore a halter monitor from 4/29-5/1 and I''m waiting for my results.

Write-up: diagnosed with Covid; diagnosed with Covid; This is a spontaneous report received from a contactable reporter(s) (Consumer or other non HCP). The reporter is the patient. A 56-year-old female patient (not pregnant) received BNT162b2 (BNT162B2), on 06Mar2021 at 13:00 as dose 1, single (Lot number: EP6955), in left arm, on 03Apr2021 at 13:00 as dose 2, single (Lot number: ER8729), in left arm and on 11Oct2021 at 13:00 as dose 3 (booster), single (Lot number: 30145BA) at the age of 55 years, in left arm for covid-19 immunisation. The patient''s relevant medical history included: "genetic hypertrophic cardiomyopathy" (unspecified if ongoing), notes: (take Verapamil for it); "dry eye (Restasis)" (unspecified if ongoing), notes: dry eye (Restasis); "hysterectomy" (unspecified if ongoing), notes: total hysterectomy at age 45 due to fibroids on HRT (Vivelle) for early menopause; "menopause" (unspecified if ongoing), notes: total hysterectomy at age 45 due to fibroids on HRT (Vivelle) for early menopause. Concomitant medication(s) included: VERAPAMIL; VIVELLE [ESTRADIOL]; RESTASIS; FISH OIL Multi-vitamin, turmeric. The following information was reported: PYREXIA (non-serious) with onset 01Apr2022, outcome "recovered" (Apr2022), described as "having a fever"; COUGH (non-serious)

with onset Apr2022, outcome "recovered" (15Apr2022), described as "Bad cough"; COVID-19 (medically significant) with onset Apr2022, outcome "recovered" (Apr2022), VACCINATION FAILURE (medically significant), outcome "unknown" and all described as "diagnosed with Covid". The events "diagnosed with covid" and "having a fever" required emergency room visit. The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: (Apr2022) Positive; (Apr2022) Negative, notes: a week later. Therapeutic measures were taken as a result of vaccination failure, covid-19, pyrexia. Therapeutic measures were not taken as a result of cough included Paxlovid.

Other Medications: Magnesium supplement 250mg daily, Naproxen 500mg as needed, Sumatriptan 50mg as needed
Current Illness: Migraines once monthly
Preexisting Conditions: Migraines once a month
Allergies: Gluten intolerance; amoxicillin; wasps stings
Diagnostic Lab Data: None
CDC Split Type: vsafe
Write-up: The same day of vaccination, I started having a migraine. It continued for several days so I had a telehealth visit with my pcp (date unknown) and they gave me a prescription for naproxen and sumatriptan. I have been taking them as needed. My migraines have increased in frequency after every vaccine. I am now experiencing migraines up to 5 times a week. In January of 2022, my doctor put me on Topiramate daily. In April 2022, I stopped that medication and changed to amlodipine. It has only made a slight difference and the topiramate works better for me but it has more side effects.

Write-up: Pericarditis/myocarditis; Pericarditis/myocarditis; This is a non-interventional study report received from a contactable reporter (Physician). A 36-year-old female patient received BNT162b2 (Pfizer Covid-19 vaccine), as dose 3, single (Batch/Lot number: unknown)

intramuscular for covid-19 immunization. The patient''s relevant medical history included: "Adult-onset Still''s disease" (ongoing); "Macrophage activation syndrome" (ongoing); "Pneumonia", start date: 06Sep2021 (unspecified if ongoing). The patent took the following concomitant medications: Salbutamol (ALBUTEROL) 90mcg inhaled, for shortness of breath, Anakinra for immune suppression, calcium 600 mg/vitamin D 400 units, cetirizine, clobetasol 0.05% ointment, dextran 70/glycerol 0.02%/hypromel 0.3%, diclofenac 1% topical gel for pain, dextromethorphan (DM)10/guaifenesin 100mg/5ml, for cough, fluticasone for allergy symptom, omeprazole, prednisone, tocilizumab 162mg autoinjector, carboxymethylcellulose 1% opth gel apply 1 drop to both eyes, three times per day, acetaminophen 500mg by mouth every 8 hours, biotin, doxepin, fish oil, and levonorgestrel; all ongoing (reported active medicines). The following information was reported: Pericarditis/myocarditis" (hospitalization) with onset 05Sep2021. "Clinical course: The patient with Adult-Onset Still''s Disease (AOSD), Macrophage Activation Syndrome, who presented to the hospital with shortness of breath and fevers 1 week after being given her 3rd dose of Pfizer''s COVID-19 vaccine. The patient was diagnosed with pneumonia as well as concomitant myopericarditis. She was noted to have elevated cardiac biomarkers which then resolved over time with treatment of both the pneumonia and the myopericarditis. The patient recovered from the event without significant adverse sequelae. In follow-up, in the outpatient setting, her Rheumatologist''s opinion was that the episode occurred as a result of the third dose of vaccine. The reporter became aware of this case while reviewing charts for patients as part of a project looking at the association between the Pfizer Covid-19 vaccine and incidence of pericarditis/myocarditis. In the reporter''s opinion, the possible causes for the episode included pericarditis associated with the patient''s episode of pneumonia, a flare of AOSD or exposure to the vaccine (due to the close temporal relationship). The patient was seen at the hospital on Sep2021 and it was unknow if an adverse reaction was reported to Pfizer for this patient at the time of the event as the reporter reviewed the events, it occurred less than 8 months after the illness occurred. The patient underwent the following laboratory tests and procedures: Troponin (0.0-0.3): (06Sep2021) 4.86 ng/ml; (07Sep2021) 4.94 ng/ml; (19Oct2021) less than 0.02 ng/ml. The action taken in response to the event was not applicable (not reported). Outcome of the event was recovered on unspecified date. The reporter considered "pericarditis/myocarditis" related to third dose of BNT162b2, but not related to concomitant medications.; Sender''s Comments: Based on known drug safety profile, there is reasonable possibility of causal association between the events pericarditis and myocarditis and BNT162B2.

Allergies:
Diagnostic Lab Data: Test Date: 2022; Test Name: Histamines; Result Unstructured Data: more active/increased
CDC Split Type: USMODERNATX, INC.MOD20225
Write-up: Across upper torso a little itchy; rash and hives on ankles, feet, toes, mainly middle lower extremities, stomach, occasionally on arm/travels throughout body; rash and hives on ankles, feet, toes, mainly middle lower extremities, stomach, occasionally on arm/travels throughout body; This spontaneous case was reported by a patient and describes the occurrence of PRURITUS (Across upper torso a little itchy), URTICARIA (rash and hives on ankles, feet, toes, mainly middle lower extremities, stomach, occasionally on arm/travels throughout body) and RASH (rash and hives on ankles, feet, toes, mainly middle lower extremities, stomach, occasionally on arm/travels throughout body) in a 61-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 027L21A) for COVID-19 vaccination. Concurrent medical conditions included Allergy to antibiotic (cillin medications) and Hashimoto''s thyroiditis. On 19-Apr-2022, the patient received fourth dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) .25 milliliter. On 29-Apr-2022, after starting mRNA-1273 (Moderna COVID-19 Vaccine), the patient experienced URTICARIA (rash and hives on ankles, feet, toes, mainly middle lower extremities, stomach, occasionally on arm/travels throughout body). On an unknown date, the patient experienced PRURITUS (Across upper torso a little itchy) and RASH (rash and hives on ankles, feet, toes, mainly middle lower extremities, stomach, occasionally on arm/travels throughout body). The patient was treated with DIPHENHYDRAMINE HYDROCHLORIDE (BENADRYL [DIPHENHYDRAMINE HYDROCHLORIDE]) at an unspecified dose and frequency; LORATADINE (CLARITINE) at an unspecified dose and frequency and PREDNISONE at an unspecified dose and frequency. At the time of the report, PRURITUS (Across upper torso a little itchy), URTICARIA (rash and hives on ankles, feet, toes, mainly middle lower extremities, stomach, occasionally on arm/travels throughout body) and RASH (rash and hives on ankles, feet, toes, mainly middle lower extremities, stomach, occasionally on arm/travels throughout body) had not resolved. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In 2022, Histamine level: more active/increased (High) more active/increased. No concomitant medications were reported. Patient''s date of birth mentioned. The patient had allergy to poison ivy. She did not have seasonal allergies and had not added any new foods to diet. Moderna 2nd booster dose Lot number was reported as 027L21A or Z1A. The patient suspected hives and rash were due to vaccine in combination with having hashimotos. She experienced hives and rash had been going for weeks and saw doctor. The rash and hives happened through the day, histamines were more active at night. Treatment with Benadryl, Claritin, prednisone made that worse. The patient had not experienced a similar event in the past.

Write-up: Patient fainted at th end of her office visit. Patient was here for her 18 yr PE. She received Hep A #1 and MCV #2. Also had point of care lipid test done via finger prick. Procedure and shots were at the end of her visit. She proceeded to get up without symptoms and head to the bathroom with the MA to give a urine sample. While in the bathroom patient described feeling

unwell and came out of the bathroom and satdown in the waiting room to which our receptionist noted something seemed wrong. She opened her window and inquired if the patient was OK to which the patient said she felt like she was going to faint. This nurse was within the reception area when the receptionist noted this response and asked me to respond. I came out to the waiting room to find her starting to slump forward and then to the side of her chair, fainting. This nurse ran to the patient catching her preventing her from falling to the floor. Another MA and nurse responded. We immediately brought her to the floor and raised her legs. She immediately became alert again and started talking with us. Patient''s mother was called into the office. The patient was given juice boxes x 2 and a pack of crackers. She admitted to not eating anything this morning prior to her office visit. After remaining in supine position for approx 10 minutes she tolerated a change to sitting then standing. After she reported feeling better she was offered to be escorted to her car with her mom. They declined an escort and were discharged.

Write-up: sick with symptoms; sinus infection; bad cold; sinus congestion; mild cough; sore throat; This spontaneous case was reported by a consumer and describes the occurrence of OROPHARYNGEAL PAIN (sore throat), ILLNESS (sick with symptoms), SINUSITIS (sinus infection), NASOPHARYNGITIS (bad cold) and SINUS CONGESTION (sinus congestion) in a 70-year-old male patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 040B21A and 046A21A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Co-suspect product included non-company product NIRMATRELVIR, RITONAVIR (PAXLOVID) for COVID-19 treatment. Concurrent medical conditions included Allergy NOS. On 20-Mar-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 17-Apr-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 12-Nov-2021, received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 14-May-2022, the patient started NIRMATRELVIR, RITONAVIR (PAXLOVID) (unknown route) at an unspecified dose. On 24-May-2022 at 7:00 PM, the patient experienced OROPHARYNGEAL PAIN (sore throat). On 26-May-2022, the patient experienced ILLNESS (sick with symptoms), SINUSITIS (sinus infection), NASOPHARYNGITIS (bad cold), SINUS CONGESTION (sinus congestion) and COUGH (mild cough). At the time of the report, OROPHARYNGEAL PAIN (sore throat), ILLNESS (sick with symptoms), SINUSITIS (sinus

infection), NASOPHARYNGITIS (bad cold), SINUS CONGESTION (sinus congestion) and COUGH (mild cough) was resolving. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 22-May-2022, SARS-CoV-2 test: neagtive (Negative) Tested negative for Covid. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Concomitant medications details were not reported by the reporter Patient was not taking any other medications/products within 2 weeks of starting COVID-19 treatment. Reportedly, Patient Last course of treatment completed on May 18, 2022. He Developed minor sore throat on May 24, 2022. By May 26, 2022, he was definitely sick with symptoms mimicking a bad cold or sinus infection. Sore throat, sinus congestion, and mild cough and reports No fever. Treatment details was not reported by the reporter. Pfizer have permission to contact them and also have permission to contact the patient''s healthcare provider about this report . The device date was reported as 28-May-2022

Write-up: first shot about a year ago, never got second; This case was reported by a consumer via call center representative and described the occurrence of incomplete course of vaccination in a patient who received Herpes zoster (Shingrix) for prophylaxis. Previously administered products included Shingrix (got first Shingrix shot about a year ago (would be confirmed) but definitely more than 6 months). On an unknown date, the patient did not receive the 2nd dose of Shingrix. On an unknown date, unknown after receiving Shingrix, the patient experienced incomplete course of vaccination. On an unknown date, the outcome of the incomplete course of vaccination was unknown. Additional Information: GSK Receipt Date: 30-MAY-2022 Reporter''s Comment: The patient never got his/her second shot of Shingrix. The reporter wanted to know how did they go about getting this finished. Additional Supportive Information: The patient did not receive the 2nd dose of Shingrix till the time of reporting, which led to incomplete course of vaccination.

Write-up: Patient was sitting on the exam table with her mom in the room as I was administering the HPV vaccine. I administered the vaccine in her RT deltoid muscle and turned around to toss away my sharps in the sharps container. As I turned back around I noticed Patient falling down off the exam table from a seated position and I was bae to run and catch her before she fell and hit the counter corner/ground in the exam room. I placed her in supine position on the exam table and she opened her eyes after about 5-10 seconds and "came to" asking what was wrong/what happened. I had her lay down for about 15 minutes and placed a cool cloth on her forehead and took her BP which did decrease a small amount from 104/64 to 90/70. Here PAP, Dr came and made sure she was doing okay before having them leave.

Current Illness: Spondyloarthropathy.
Preexisting Conditions:
Allergies:

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20225
Write-up: COVID-19; This spontaneous case was reported by a patient and describes the occurrence of COVID-19 (COVID-19) in a 63-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 032F21A and 032BZIA) for COVID-19 vaccination. Concurrent medical conditions included Spondyloarthropathy. Concomitant products included CELECOXIB and CITALOPRAM for an unknown indication. On 04-May-2021, the patient received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 11-Nov-2021, received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On an unknown date, the patient experienced COVID-19 (COVID-19). The patient was treated with NIRMATRELVIR, RITONAVIR (PAXLOVID) from 26-May-2022 to 01-Jun-2022 for COVID-19 treatment, at an unspecified dose and frequency. At the time of the report, COVID-19 (COVID-19) outcome was unknown. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. Patient has no known drug allergies. She felt better on May. Device date:03Jun2022 Company comment: This is a spontaneous case concerning a 63-year-old, female patient with no relevant medical history and with vaccine history of receiving unknown dose number of mRNA-1273 vaccine on 4 May 2021, who experienced the unexpected non-serious event of Covid-19. The event occurred approximately 6 months after the unknown dose number of mRNA-1273 vaccine administration on 11 November 2021. Allegedly the event was described as, approximately 174 days after the most recent unknown dose number of mRNA-1273 vaccine administration, patient took Nirmatrelvir + Ritonavir (Paxlovid) for treatment of Covid-19. No other information surrounding the event was reported. The outcome of the event was reported as not resolved from the time of last observation. The current Covid-19 pandemic remain confounder for the event. The benefit-risk relationship of mRNA-1273 vaccine is not affected by this report. Sender''s Comments: This is a spontaneous case concerning a 63-year-old, female patient with no relevant medical history and with vaccine history of receiving unknown dose number of mRNA-1273 vaccine on 4 May 2021, who experienced the unexpected non-serious event of Covid-19. The event occurred approximately 6 months after the unknown dose number of mRNA-1273 vaccine administration on 11 November 2021. Write-up: to use other arm to move that arm, it is slightly better/If she engaged her muscle she would not lift it; painful/this is day 12 of pain and describes it as severe/It hurt so much; it was an unusually painful injection; muscle pain and weakness/muscle soreness; muscle pain and weakness; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP) from medical information team, Program ID: (005570). The reporter is the patient. A 65-year-old female patient received pneumococcal 20-val conj vac (dipht CRM197 protein) (PREVNAR 20), on 27May2022 as dose number unknown, 0.5ml single (Lot number: FJ2601) at the age of 65 years, in left arm for immunisation. The patient''s relevant medical history included: "No" (unspecified if ongoing), notes: Verbatim : Other Conditions: No. There were no concomitant medications. Vaccination history included: pfizer covid-19 vaccine (1st dose, Lot: ER8727, Expiration: Unknown, Dose: 0.3ml in the Right arm), administration date: 27Mar2021, when the patient was 64-year-old, for COVID-19 immunization; pfizer covid-19 vaccine (2nd dose, Lot: EW0161, Expiration: Unknown, Dose: 0.3ml in the Left Arm), administration date: 17Apr2021, when the patient was 64-year-old, for COVID-19 immunization; pfizer covid-19 vaccine (3rd dose, Lot: 32030DB, Expiration: Unknown, Dose: 0.3ml in the Left arm), administration date: 25Oct2021, when the patient was 64-year-old, for COVID-19 immunization; moderna covid-19 vaccine (Date: 31Mar2022, Lot: 066K21A, Expiration: Unknown, Dose: Injection in the left arm), administration date: 31Mar2022, when the patient was 65-year-old, for COVID-19 immunization. The following information was reported: VACCINATION SITE PAIN (non-serious) with onset 27May2022, outcome "unknown", described as "it was an unusually painful injection"; MUSCULAR WEAKNESS (non-serious) with onset 27May2022, outcome "unknown", described as "muscle pain and weakness"; MYALGIA (non-serious) with onset 27May2022, outcome "recovering", described as "muscle pain and weakness/muscle soreness"; MOBILITY DECREASED (non-serious), outcome "unknown", described as "to use other arm to move that arm, it is slightly better/If she engaged her muscle she would not lift it"; PAIN (non-serious), outcome "unknown", described as "painful/this is day 12 of pain and describes it as severe/It hurt so much". Additional information: Patient never felt disabled by a vaccine before. Caller stated this was day 12 of pain and describes it as severe. It was painful to even lay on that side. Patient thought it was regular vaccine soreness. If patient engaged her muscle she would not lift it. She would use her other arm to not engage the muscle it was so painful. Caller said that she had a sore arm after her Covid

vaccines for a day or so at the injection site. No significant side effects from the Covid vaccines. Patient got both Moderna and Pfizer Vaccines. Patient got the Moderna Dose at Pharmacy. The rest of the Covid-19 vaccines received at another pharmacy. No follow-up attempts are possible. No further information is expected.

Write-up: sore arm after her Covid vaccines for a day or so at the injection site; This spontaneous case was reported by a patient and describes the occurrence of VACCINATION SITE PAIN (sore arm after her Covid vaccines for a day or so at the injection site) in a 65-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch no. 066K21A) for COVID-19 prophylaxis. Previously administered products included for Product used for unknown indication: PFIZER BIONTECH COVID-19 VACCINE (1st dose, Lot number ER8727, 0.3ml in the Right arm) on 27-Mar-2021, PFIZER BIONTECH COVID-19 VACCINE (2nd dose, Lot number EW0161, 0.3ml in the left arm) on 17-Apr-2021, PFIZER BIONTECH COVID-19 VACCINE (3rd dose, Lot number 32030DB and 0.3ml in the Right arm) on 25-Oct-2021. Past adverse reactions to the above products included Vaccination site pain with PFIZER BIONTECH COVID-19 VACCINE, PFIZER BIONTECH COVID-19 VACCINE and PFIZER BIONTECH COVID-19 VACCINE. On 31-Mar-2022, the patient received fourth dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On an unknown date, the patient experienced VACCINATION SITE PAIN (sore arm after her Covid vaccines for a day or so at the injection site). At the time of the report, VACCINATION SITE PAIN (sore arm after her Covid vaccines for a day or so at the injection site) had resolved. No concomitant product reported by reporter. Patient was administered with Prevnar 20 on 27-May-2022 with lot number FJ2601 0.5ml ml injection in left arm and experienced muscle sore on 27-May-2022 and outcome was recovering. It was the most painful shot she had ever gotten. Patient was not sure if the symptoms she was feeling were from the product or from the way the pharmacist administered it. Patient arm was sore as usual. Patient muscle was so sore that she had to use her other arm to lift her left arm up so she would not engage the muscle.she had a sore arm after her COVID vaccines for a day or so at the injection site. No significant side effects from the COVID vaccines. No treatment medication reported by reporter.

Write-up: Vaccination failure; COVID 19 Treatment; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP). The reporter is the patient. A 48-year-old female patient (not pregnant) received BNT162b2 (BNT162B2), on 10Apr2021 as dose 1, single (Lot number: EP7533), in right arm and on 01May2021 as dose 2, single (Lot number: ER8736) at the age of 47 years, in right arm for covid-19 immunisation; coviD-19 vaccine mrna (mrna 1273) (MODERNA COVID-19 VACCINE), on 16Nov2021 as dose 3 (booster), single (Lot number: 037F21A), in right arm for covid-19 immunisation. The patient''s relevant medical history was not reported. Concomitant medication(s) included: TYLENOL, start date: 26May2022, stop date: 08Jun2022. The following information was reported: VACCINATION FAILURE (medically significant), outcome "not recovered"; COVID-19 (medically significant), outcome "not recovered", described as "COVID 19 Treatment". The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: (unspecified date) Unknown Results, notes: Indication: Covid-19 immunization; (04Jun2022) Negative; (08Jun2022) Positive. Therapeutic measures were taken as a result of vaccination failure, covid-19.

CDC Split Type:
Write-up: On April 28, 2022, I got hives on my elbows which were unbearably itchy. The hives became hives and a red rash and spread up my arms and my torso, especially on my right side. Previous rashes had responded to Kenalog cream. This rash did not. Went to dermatologist on May 11, 2022. The physician?s assistant said she the uticaria was due to my second COVID booster, which I?d gotten about three weeks earlier, on April 4. She gave me a steroid injection (Kenalog) and a stronger steroid cream (Clobetasol, which is mixed with CeraVe cream). This turned out to not be enough. On May 20, I called her. She told me I could use the Clobetasol three times a day and she gave me a prescription antihistamine, Hydroxyzine Hydrochloride. I take two pills at bedtime along with a Zyrtec.

Write-up: On May 3, 2022 I started feeling run down, I had a little cough, and sore throat. I did a home COVID 19 test that came back negative. The next morning I still fell unwell so I took another home COVID 19 test, this one came back positive. I called my doctor, since I am on immunosuppressant drugs I am not a candidate for Paxlovid. I was referred to the hospital for the monoclonal antibody infusion, I felt better within three days of having the infusion.

CDC Split Type: USMODERNATX, INC.MOD20225
Write-up: Mild heart palpitations for several days after vaccination; Fever for several days after vaccination; Fatigue for several days after vaccination; This spontaneous case was reported by a patient and describes the occurrence of PALPITATIONS (Mild heart palpitations for several days after vaccination), PYREXIA (Fever for several days after vaccination) and FATIGUE (Fatigue for several days after vaccination) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 prophylaxis. No Medical History information was reported. On 13-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 10-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On an unknown date, the patient experienced PALPITATIONS (Mild heart palpitations for several days after vaccination), PYREXIA (Fever for several days after vaccination) and FATIGUE (Fatigue for several days after vaccination). At the time of the report, PALPITATIONS (Mild heart palpitations for several days after vaccination), PYREXIA (Fever for several days after vaccination) and FATIGUE (Fatigue for several days after vaccination) had resolved. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter considered PALPITATIONS (Mild heart palpitations for several days after vaccination), PYREXIA (Fever for several days after vaccination) and FATIGUE (Fatigue for several days after vaccination) to be related. Patient will play golf and walks 3 miles (4 times weekly). No concomitant medications were provided by the reporter. Other treatment medications includes Paxlovid, Shingrix, Escitalopram. Patient''s lab data includes Abnormal EKG''S, had Echocardiogram, Cardiac MRI - Determined to have PAC, PVC arrhythmias. This case was linked to MOD-2022-590374 (Patient Link).

Write-up: She got her vaccine at 1:00 PM, she ate and drank enough. The next day at 1:00 PM she was a theater and did not feel very well, and was going to the bathroom and halfway up the stairs she felt dizzy. She then had an Aura, with her is a curious smell. She got on top of the steps, when down an elevator and told them that she was going to have a seizure, which she was helped with two people. They helped her lie down, and they called an ambulance and she woke up in the hospital. They kept her a few hours, gave her the Vimpat and was sleepy. The next day she felt Okay. This also happened with her 3rd shot as well. 24 hours after the vaccine she had a seizure. She sat down with her friend after the 2nd one, he could not understand what she was saying, called the ambulance and then woke up about 4 hours later in the hospital. Hospital. She has not had any other reactions, and does take her Vimpat which is seizure medicine. She only had the reaction with the 2 boosters.

Write-up: PAC/Arrhythmia, Palpitations,Pulse irregular; PVC/Arrhythmia, Palpitations,Pulse irregular; High fever; Covid; This spontaneous case was reported by a patient and describes the occurrence of SUPRAVENTRICULAR EXTRASYSTOLES (PAC/Arrhythmia, Palpitations,Pulse irregular) and VENTRICULAR EXTRASYSTOLES (PVC/Arrhythmia, Palpitations,Pulse irregular) in a 68-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 prophylaxis. The occurrence of additional non-serious events is detailed below. No Medical History information was reported. On 13-Jan-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 10-Feb-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 24-Sep-2021, received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 100 microgram. On 07-May-2022, the patient experienced COVID-19 (Covid). On an unknown date, the patient experienced SUPRAVENTRICULAR EXTRASYSTOLES (PAC/Arrhythmia, Palpitations, Pulse irregular) (seriousness criterion medically significant), VENTRICULAR EXTRASYSTOLES (PVC/Arrhythmia, Palpitations, Pulse irregular) (seriousness criterion medically significant) and PYREXIA (High fever). The patient was treated with NIRMATRELVIR, RITONAVIR (PAXLOVID) from 07-May-2022 to 11-May-2022 for COVID-19, at a dose of 10 milligram twice a day. At the time of the report, SUPRAVENTRICULAR EXTRASYSTOLES (PAC/Arrhythmia, Palpitations, Pulse irregular), VENTRICULAR EXTRASYSTOLES (PVC/Arrhythmia, Palpitations, Pulse irregular) and COVID-19 (Covid) had resolved and PYREXIA (High fever) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 07-May-2022, SARS-CoV-2 test: positive (Positive) Positive. On 18-May-2022, SARS-CoV-2 test: positive (Positive) Positive. On an unknown date, Echocardiogram: determined to have pac, pvc Determined to have PAC, PVC. On an unknown date, Electrocardiogram: abnormal Abnormal. On an unknown date, Magnetic resonance imaging heart: determined to have pac, pvc Determined to have PAC, PVC. For mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown), the reporter did not provide any causality assessments. No concomitant medications were provided by the reporter. Patient experienced high fever, shortness of breath and patient still experiencing fatigue/slight fatigue, occasional dizziness. Event PAC, PVC and arrhythmia resolved on their own after several months. Patient was prescribed Paxlovid as a precaution primarily due to Cardiac issues in previous months. Patient could play golf and walks 3 miles (4x weekly). It was stated that patient was not sure cardiac issues were result of vaccine.~ Patient received other drugs Shingrix on 02-May-2022 (Second Shingrix vaccine) and stopped and In Mar-2022, Escitalopram 5 mg daily and this was still ongoing. On 18-May-2022 patient was tested positive for Covid second time. Patient was not hospitalized due to the event and not received any treatment. Company Comment: This spontaneous case concerns a 68-year-old female patient with no medical history reported, who experienced the unexpected, serious (medically significant) adverse events of special interest Supraventricular extrasystoles, and Ventricular extrasystoles, and the unexpected, non-serious adverse event of special interest COVID-19. The events Supraventricular extrasystoles, and Ventricular extrasystoles occurred on an unknown date after, and the event COVID-19 occurred 7 months and 13 days after receiving third dose of mRNA-1273 vaccine. Patient presented with palpitations, fatigue, shortness of breath, and erratic pulses for which premature atrial contraction (PAC) and premature ventricular contractions (PVC) were diagnosed by a cardiologist after

electrocardiogram, echocardiogram and cardiac magnetic resonance imaging were performed. The diagnosis of COVID-19 was supported by a SARS-CoV-2 test was positive. Patient received a 2-dose primary series of mRNA-1273 vaccines given 28 days apart, with the last dose administered 7.5 months prior to current mRNA-1273 vaccine. The benefit-risk relationship of mRNA-1273 vaccine is not affected by this report. This case was linked to MOD-2022-590217 (Patient Link).; Sender''s Comments: This spontaneous case concerns a 68-year-old female patient with no medical history reported, who experienced the unexpected, serious (medically significant) adverse events of special interest Supraventricular extrasystoles, and Ventricular extrasystoles, and the unexpected, non-serious adverse event of special interest COVID-19. Write-up: Treatment of COVID-19; Treatment of COVID-19; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP). The reporter is the patient. A 39-year-old female patient (not pregnant) received BNT162b2 (COMIRNATY), on 31Oct2021 as dose 3 (booster), single (Batch/Lot number: unknown) at the age of 39 years, in left arm for covid-19 immunisation; coviD-19 vaccine (COVID-19 VACCINE), as dose 1, single (Batch/Lot number: unknown) and as dose 2, single (Batch/Lot number: unknown) for covid-19 immunisation. The patient''s relevant medical history included: "Asthma" (unspecified if ongoing); "ulcerative colitis" (unspecified if ongoing); "Seasonal allergies" (unspecified if ongoing), notes: Seasonal allergies. The patient''s concomitant medications were not reported. The following information was reported: DRUG INEFFECTIVE (medically significant), COVID-19 (medically significant) all with onset Jun2022, outcome "unknown" and all described as "Treatment of COVID-19". The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: (10Jun2022) negative, notes: day 8; (11Jun2022) negative, notes: day 9; (12Jun2022) negative, notes: day 10; (Jun2022) positive. Therapeutic measures were taken as a result of drug ineffective, covid-19. Clinical course: The patient was taking other medications/products within 2 weeks of starting COVID-19 treatment. The patient previously receive a COVID-19 Vaccine. The information on the batch/lot number for BNT162b2 has been requested and will be submitted if and when received.

Write-up: By the time I got home, I knew I was extremely tired. That continued to increase as the evening went on so I ended up going to bed early for me. I took a Tylenol. I drank a lot of fluids and went to bed. I got up in the morning and I didn"t even want to move. I was so exhausted. I experienced headache and body aches. I had a low grade fever off and on...very low grade. I experienced sweats off and on and a general sense of malaise. The exhausting was debilitating and lasted about 3 weeks.

Write-up: Breakthrough COVID Case: I first felt really exhausted and had blurry vision. My eyes were kind of itchy and my glands on the left side were kind of itchy. I didn''t think much of it. I thought maybe it was my Epstein Bar. When I got up in the morning, I was congested and sneezing and coughing. I took one of the home tests and it came out positive. It stayed in my head for several days. I was running a fever at about 102 which is high for me. I usually run 97. I think by day 6, it started to move to my lungs and I was very rattly. I called my primary care. They called back to suggest I get the monoclonal antibody treatment. I had that treatment 2 days after my call. I also lost my sense of smell. After the treatment, within 24 hours, I regained some of my sense of smell. Within a couple of days, I wasn''t as short of breath or rattly so much. During this time, I had to use my Advair 2 times per day and my albuterol at least 2-3 times a day. I was so exhausted. Every little thing I did wore me out. I felt that way for one full week after that antibody treatment. For a few days, after that, I felt like I was making headway. I could walk my dog a little more without getting short of breath. Then, I felt like I got hit again. The itchiness in the glands returned with full force and along the side of my left nose because really itchy. My forehead was itchy. I started having pins and needles in my fingers and in the outside of my legs. That comes and goes. I had a herpes outbreak. I usually get them on my nose. I had to use Acyclovir cream. It cleared up within a couple of days, but the exhaustion started again really bad. Each day, I was able to do less and less. I had my 4th outbreak of a herpes sore since I got COVID. I normally get one or maybe 2 per year. I tried to walk the other day with a friend, but I was frighteningly short of

breath. I"ve continued to have eye pressure and itchiness. I had it checked by an eye doctor. They said it wasn"t anything serious so I think its related to the virus. I get palpitations from time to time. Brain fog, and I"ve had brain fog with chronic fatigue, but this is a whole new level.

CDC Split Type:
Write-up: She got her vaccine, she felt the pinch of the needle and that was it, soreness. She walked over to the viewing area, and she started clearing her throat all the time, then she started getting itchy on her chest, and she started breaking out in hives, her breathing became shallow/different, tight in her chest, her throat was definitely tight and clearing her throat. She felt light headed, and her hands were shaking. Somebody monitoring her saw the breakout of the

hives and was pulled over by what she thought was a doctor behind a screened in area where he put a pulse oximeter on her finger, told her to take deep breaths, listened to her chest, and to see her stomach which was also broken out into hives. She was getting a little dizzy, more difficulty breathing, the clearing of the throat was more, and he administered oxygen. She also had tingling in her hands, and she also had a time sticker on her for the 15 minute interval, and was past that 15 minute time mark about 30 minutes or so. She stayed on a gurney in this area, and thought that it would be reported. She believes that the person was a doctor from the hospital. She was given water. About 1/2 hour later the hives started to subside, her hands were shaking less, and he told her that she had a very severe allergic reaction and he did not recommend a 2nd vaccine. She remembers scheduling the next shot immediately after the shot and did not go to it. She was sent home, was told to take large amounts of non-drowsy antihistamines. She does not remember getting anything or given anything for the reaction. Recommended her to take cinnarizine, and if she did not get better to go to the ER if she did not have any trouble breathing. She was well enough that he was comfortable for her to go home. When she got home she felt like flu-like symptoms, felt like she got hit by a truck. Her bones hurt, she had a low-grade fever for 2 days following the vaccine. Her arm hurt at the injection site, there was a large puffy swollen area around the injection site. She was emotionally upset, and didn''t feel good. She was crying which she is not normally like this, no appetite, her body hurt. She was taking Ibuprofen, had no more hives, but did have a headache, just felt bad. She saw her doctor for routine visit and informed her of the events, and she informed her that she should not get anymore vaccines. In December of 2021 she wrote her a medical exemption letter for not getting anymore vaccines. They called to remind her of the vaccine, and she informed them of the AE, which they did not have any documentation of this.

The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: (20Jun2022) Positive; (21Jun2022) Positive; (24Jun2022) Positive; (26Jun2022) Positive; (27Jun2022) Negative; (29Jun2022) Negative; (30Jun2022) Positive; (01Jul2022) Positive; (02Jul2022) Positive. Therapeutic measures were taken as a result of vaccination failure, covid-19 included: nirmatrelvir; ritonavir (PAXLOVID). Clinical course: tested positive on 20Jun2022. Took nirmatrelvir; ritonavir from 21Jun2022 to 25Jun2022. Significant symptoms initially that improved and then resolved with nirmatrelvir; ritonavir. Tested positive on 21Jun2022, 24Jun2022, and 26Jun2022. Tested negative and symptom-free 27Jun2022 and 29Jun2022. Symptoms returned late in the day on 29Jun2022. Tested positive 30Jun2022, 01Jul2022, and 02Jul2022. Mild symptoms so far in second round.

Write-up: On 4/6/2022, I received my second Pfizer booster for COVID-19. On 6/28/2022, I began almost constantly coughing and had sore throat with throat congestion and extreme fatigue. On 6/29/2022, I took an at-home test for COVID-19, and the result was positive. I called my doctor''s office. They asked me if I wanted an antiviral, and I let them prescribe me Paxlovid. However, I only took a couple of the Paxlovid, as they are huge pills, and I''m afraid of choking. I contacted my doctor to let her know, and I was prescribed molnupiravir in place of the Paxlovid, I took a couple of the molnupiravir capsules, but I also had difficulty swallowing those. I informed my doctor of this, and she was fine with my discontinuing the medication. I saw my doctor on 7/5/2022 for an annual exam. I actually felt well that day, but 7/6/2022, I was extremely fatigued. Since 7/4/2022, the coughing has greatly diminished. At the time of this writing, the sore throat and congestion are gone. The only lingering symptom is the fatigue, and I have good and bad days. There are days in which I feel fine and have my normal level of energy, but then are also days in which I am wiped out.

Write-up: My symptoms began 06/19/2022. I had a low fever of around 100. I also had a nonproductive cough, muscle aches and general malaise. I tested positive with a home test on the morning of 06/21/2022. I called my doctor?s office and they called in Paxlovid. I took my first dose early afternoon of that day. My symptoms were not really bad, I had a good cough, and my fever went up to 101.3. Within 2 days I was much better, I still had the cough. I typically have long bouts of colds; I currently just have a tickle in my throat, which I feel would last for another week with my illness history. I have been able to do a few hikes that I lead without a lot of problems, slight shortness of breath and some achy muscles although these may just be within my normal range.

Write-up: Rabavert administered in the gluteal muscle; Case reference number US-BN-2021-002544 is a spontaneous case report initially received from a health care professional via regulatory authority (reference ID: USBAV21-0636) on 17-Dec-2021 and concerns a female patient of unspecified age. The patient''s medical history and concomitant medication details were not provided. On an unspecified date, the patient found a bat in her bedroom, however, no bite wound was found. On an unspecified date, the patient was vaccinated with RabAvert (inactivated rabies virus vaccine; batch number: not reported) at an unknown dose, in the gluteal muscle via intragluteal route of administration, for post-exposure prophylaxis (explicitly coded as " Vaccine administered at inappropriate site'') At the time of this report, it was not known whether the patient experienced any adverse event. Additional information received on 20-Dec-2021: included local BN case ID. No further information was provided.; Reporter''s Comments: The female patient of unspecified age was vaccinated with RabAvert in the gluteal muscle, for post-exposure prophylaxis, which is considered as product administered at inappropriate site. No associated adverse events have been reported with the reported medication error. The product administered at inappropriate site is considered as listed per convention. The patient''s medical history and concomitant medication details were not provided. The product administered at inappropriate site has been considered as not related to the suspect vaccine, but to a human action. This case is considered as non-serious.; Sender''s Comments: The female patient of unspecified age was vaccinated with RabAvert in the gluteal muscle, for post-exposure prophylaxis, which is

considered as product administered at inappropriate site. No associated adverse events have been reported with the reported medication error. The product administered at inappropriate site is considered as listed per convention. The patient''s medical history and concomitant medication details were not provided. The product administered at inappropriate site has been considered as not related to the suspect vaccine, but to a human action. This case is considered as non-serious.

Write-up: She did not get COVID even though she was with her daughter the whole time; Difficulty breathing; Dizzy; Weak; Chest pain; Felt the heaviness in the chest; Tired; Muscle pain; Chills; Nauseous; Felt pain on the opposite arm and it was not red; This is a spontaneous report received from a contactable reporter(s) (Consumer or other non HCP) from medical information

team. The reporter is the patient. A 77-year-old female patient received BNT162b2 (BNT162B2), on 29Jun2022 as dose 4 (booster), single (Lot number: 7135) at the age of 77 years, in left arm for covid-19 immunisation. The patient''s relevant medical history included: "Afib" (unspecified if ongoing). There were no concomitant medications. Vaccination history included: BNT162b2 (First Dose : Lot EN6201, Vaccine location: Left arm, dose 1), administration date: 13Feb2021, when the patient was 75-year-old, for Covid-19 immunization; BNT162b2 (Second dose :Lot EN6198, Vaccine location: Left arm, dose 2), administration date: 05Mar2021, when the patient was 76-year-old, for Covid-19 immunization; BNT162b2 (First Booster: Lot 101#331308A, Vaccine location: Left arm, dose 3 booster), administration date: 18Dec2021, when the patient was 76-year-old, for Covid-19 immunization. The following information was reported: CHEST PAIN (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022); CHILLS (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022); DYSPNOEA (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "Difficulty breathing"; DIZZINESS (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "Dizzy"; PAIN IN EXTREMITY (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "Felt pain on the opposite arm and it was not red"; CHEST DISCOMFORT (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "Felt the heaviness in the chest"; MYALGIA (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "Muscle pain"; NAUSEA (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "Nauseous"; EXPOSURE TO SARS-COV-2 (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "She did not get COVID even though she was with her daughter the whole time"; FATIGUE (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "Tired"; ASTHENIA (non-serious) with onset 01Jul2022, outcome "recovered" (Jul2022), described as "Weak". Relevant laboratory tests and procedures are available in the appropriate section. Additional information: The patient asked why she did not get COVID even though she was with her daughter the whole time. She stated that she also had her 1st and 2nd booster dose and her daughter and grandson tested positive for COVID through a home kit in Feb, she was with them the whole time without any mask on, but she did not test positive. She wanted to know if there was a way for her to get a blood work or test to check if she has antibody against COVID. she mentioned that she did not have fear of the disease because she feels that she has more than enough protection. She stated that her doctors were against her staying with her daughter and mentioned that she thought that it should be fine for her since the vaccine should be able to protect her. She clarified what she meant by her having a reaction to this last one, she experienced difficulty breathing, at first, she was not sure why, so then she read the paperwork to see, she was able to check off difficulty breathing, dizzy, and weak. It did not last long, it lasted just day or 2. She also experienced chest pain, it was like an elephant sitting on her chest. She was tired, had muscle pain, chills, she was nauseous but didn''t throw up. She did not have arm pain where the injection site was but felt pain on the opposite arm and it was not red, that''s the way it usually was. She again stated that she is not sure if this is all related. she stated that she doesn''t know when it started, she recalled thinking oh gosh she doesn''t feel well, maybe it''s a reaction, she read it as it was something that came across, something effecting her. She got the shot in the doctors office, when she came home she didn''t feel bad, the next day she even took her bandage off on 30Jun2022, and asked her daughter if she saw anything because her daughters usually gets red, hard, and hot but her daughter told her she saw nothing on her arm. She stated that then it was the first of July when she felt the heaviness in the chest and everything she said prior. No investigation, she was at the doctors office because she had a blood test, she didn''t receive any shots at the visit except this. She did not think she needed it, but she could tell by her doctors eyes that she wanted to her to get it. she clarified that the Blood work was on Monday 27Jun2022 and appointment was on Wednesday 29Jun2022, the blood work was cholesterol and other stuff they check regularly, there was some stuff that went up and down. She

asked if there is any way that she can find out how much antibodies she has developed against Covid, like how much her blood is protected and stated that she is asked because her daughter and grandson both tested positive back in Feb2022, she stated that she has ate off the same plate as them and even drank off the same glass, her doctor advised her to leave the house and wear a mask but she felt she should get the disease thinking even if she got it she wont die, however she stated that she never got sick, they both tested positive but she did not test positive, when she asked the doctor about it, she said maybe they weren''t in full grips of it. There is a product complaint to report. Description of complaint: patient asked if there is any way that she can find out how much antibodies she has developed against Covid, like how much her blood is protected. Caller states that she is asking because her daughter and grandson both tested positive back in Feb2022, however she stated that she never got sick, they both tested positive, but caller did not test positive, when she asked the doctor about it, she said maybe they weren''t in full grips of it.

Write-up: The adverse event is that this patient was accidentally given a 4th dose of Pfizer covid vaccine today, 7/11/22, when it is not authorized for her age group. The patient came in and requested her booster and was given a booster before realizing she was not eligible as she had already received her booster dose on 12/21/21. She is not immunocompromised. Patient was made aware and instructed to let us know any adverse reactions she may experience.

Write-up: 04/03/2022 vaccination. 07/08/2022 evening, I felt unwell. I started to have a sore throat, congestion and headache. It wasn''t that bad. I didn''t think much of it. I did take a COVID-19 x2; negative (I was at the airport). 07/09/2022 Felt the same that evening; not well. Felt like a little cold. 07/10/2022 I felt ok. 07/11/2022 Monday morning I felt sick. My whole nose hurt, uncomfortable at the top. I had a headache across my forehead, was coughing that night and felt "heavy" and exhaustion. I tested COVID-19 positive, called my doctor and anyone I was near those few days. My PCM prescribed PAXLOVID 5 days worth. 07/13/2022 was the worst day in regards to exhaustion. Too much energy to move. 07/14/2022 I don''t feel great but my head feels more clear and I have a little more energy.

Write-up: SUSPECTED CLINICAL VACCINATION FAILURE; SUSPECTED COVID-19 INFECTION; This spontaneous report received from a patient via other manufacturer (Pfizer Inc) concerned a 49 year female. The patient''s height, and weight were not reported. The patient''s concurrent conditions included: drug allergy (Codeine). The patient received covid-19 vaccine ad26.cov2.s (Dose number in series 1) (suspension for injection, route of admin not reported batch number: unknown, expiry: unknown) dose was not reported, 1 total, administered on 24-APR-2021 at right arm for prophylactic vaccination. The batch number was not reported and has been requested. Age at time of vaccination 48 years old. The concomitant medication included: Allegra, Flonase, Ibuprofen started (product name unknown) on 30-APR-2022. The patient also received Moderna covid-19 vaccine (elasomeran) (Dose number in series 2) (form of admin, route of admin not reported, batch number: Unknown, expiry: Unknown) dose was not reported, administered on 24-OCT-2021 at left arm for prophylactic vaccination. On 23-JUN-2022, the patient experienced rebound of symptoms started 5 days after ending paxlovid (suspected covid-19 infection) (Dose number in series 2) which resulted to suspected clinical vaccination failure (Dose number in series 1). On 24-JUN-2022, patient received treatment of Albuterol (salbutamol). The patient also took non company suspect paxlovid (form of admin, route of admin was not reported, batch number: Unknown, expiry: Unknown) dose was not reported, administered from 14-JUN-2022 to 18-JUN-2022 for covid-19 infection. The action taken with covid-19 vaccine ad26.cov2.s and elasomeran was not applicable and with paxlovid was drug discontinued. The patient had not recovered from suspected covid-19 infection, and the outcome of suspected clinical vaccination failure was not reported. This report was serious (Other Medically Important Condition). This report was associated with product quality complaint.; Sender''s Comments: V0-20220708748-covid-19 vaccine ad26.cov2.s-suspected clinical vaccination failure. The event(s) has a compatible/suggestive temporal relationship, is unlabeled, and has unknown scientific plausibility. There are other factors more likely to be associated with the event(s) than the drug. Specifically: SPECIAL SITUATIONS. Therefore, this event(s) is considered not related.

CDC Split Type: USMODERNATX, INC.MOD20226
Write-up: Pain in her legs; Can''t walk; Limited mobility; This spontaneous case was reported by a

consumer and describes the occurrence of PAIN IN EXTREMITY (Pain in her legs), GAIT DISTURBANCE (Can''t walk) and MOBILITY DECREASED (Limited mobility) in a 25-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) for COVID-19 vaccination. No Medical History information was reported. On an unknown date, the patient received dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On an unknown date, the patient experienced PAIN IN EXTREMITY (Pain in her legs), GAIT DISTURBANCE (Can''t walk) and MOBILITY DECREASED (Limited mobility). The patient was treated with GABAPENTIN at an unspecified dose and frequency. At the time of the report, PAIN IN EXTREMITY (Pain in her legs) and MOBILITY DECREASED (Limited mobility) had not resolved and GAIT DISTURBANCE (Can''t walk) was resolving. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): On 24-Jun-2022, SARS-CoV-2 test positive: Positive. On an unknown date, Blood test: Got blood tested but every test comes out fine.. On an unknown date, Magnetic resonance imaging: Patient had 8 MRIs. The action taken with mRNA-1273 (Moderna COVID-19 Vaccine) (Unknown) was unknown. Patient consulted visited 2 Neurologist,one Orthopedic specialist. Patient is an Athletic trainer and her mobility is so limited that it''s hard to do her job. Concomitant medications was not provided by the reporter. Patient received a Moderna covid-19 vaccine and a month after she stated to feel pain in her legs and started to use crutches so that she can walk. Patient had no allergies. Treatment Crutches, Gluten Dairy and Sugar free diet, Homeopathic medicines, PT, Acupuncture were provided.

Previous Vaccinations: Flu vaccine (2012), 1, 2, dose of COVID (1/28/21, 02/15/2021).
Other Medications: XARELTO
Current Illness: N/A
Preexisting Conditions: Atrial fibrillation
Allergies: Flu shot; AUGMENTIN
Diagnostic Lab Data: N/A
CDC Split Type: vsafe
Write-up: All of suddenly, my face was turning red like burn, then my hands. I was holding my hand and my hand was burning, swollen, like a lobster. Similar reaction to a flu shot that I had before. I called the doctor and they told me if impact my breath go to the emergency room. I

decided not to go since it wasn''t that severe. Eventually it passed after 24 hours. At the end of May, I got COVID, I got a home test and it was positive. I was extremely exhausted, very thirsty, a lot of pressure on the ears and Sinus, lack of infection. The worst was my head congestion, loss of hearing because the pressure on the ears and I still have some caught periodically. Suddenly, my hands were shaking, my legs were shaking too and I collapsed over the floor. I had a nurse that comes to check me out but she said it was not a stroke, I had some sugar, some food, drink water and it took a while but by the next day I was okay.

Diagnostic Lab Data:
CDC Split Type: USPFIZER INC202200966349
Write-up: experienced a couple of allergic reactions after receiving both the first; difficulty swallowing water; difficulty breathing; This is a spontaneous report received from a contactable reporter(s) (Pharmacist) from medical information team. A 58-year-old female patient received BNT162b2 (COMIRNATY), as dose 1, single (Batch/Lot number: unknown) for covid-19 immunisation. The patient had no relevant medical history. There were no concomitant medications. The following information was reported: HYPERSENSITIVITY (non-serious), outcome "unknown", described as "experienced a couple of allergic reactions after receiving both the first"; DYSPHAGIA (non-serious), outcome "unknown", described as "difficulty swallowing water"; DYSPNOEA (non-serious), outcome "unknown", described as "difficulty breathing". Additional information: Caller stated that one patient (female, 58 years of age) experienced a couple of allergic reactions after receiving both the first and the second dose of the Pfizer-

BioNTech COVID-19 Vaccine. Caller stated that these 58 years-old patients is supposed to receive Ruxience, but they are concerned that she experiences another allergic reaction like the one she had against Comirnaty. Caller would like if there were ingredients in common between these two products. Caller would like to know if there''s information on what ingredients are the patients allergic to, in regard to the Pfizer COVID-19 vaccine. The first time the patient had difficulty swallowing water and with the 2nd dose even after taking Benadryl she had difficulty breathing. Benadryl: not suspect on product. Caller stated even after taking Benadryl she had difficulty breathing. The information on the batch/lot number for BNT162b2 has been requested and will be submitted if and when received.; Sender''s Comments: Linked Report(s) : US-PFIZER INC-202200966459 Same patient/product, different dose/event (dose 2);

Allergies: PCN
Diagnostic Lab Data: skin biopsy 11/23/2021: perivascular dermatitis with eosinophils most consistent with a drug-related eruption allergy panel 3/10/22: negative celiac testing 3/10/2022: negative
CDC Split Type:
Write-up: Pt sent a message on 6/3 that he had developed a full-body blistering rash which was initially thought to be related to poison ivy. He was treated with a course of prednisone, which was moderately helpful. It was treated throughout the summer with intermittent topical steroids. However, the rash persisted in a waxing and waning fashion until after his booster on 10/28/2021. At that point the rash became markedly worse and did not respond to another course of steroids. On 11/23/2021 I did a punch biopsy which was consistent with a drug reaction. We stopped all of his medications at that point, and his rash got a little better. However, he started having runs of rapid heart beat so was started on diltiazem (assuming that the metoprolol was a cause), and then his A1c worsened and because he had been on metformin in the past, this was restarted. Nothing changed the presentation of the rash. He was referred for allergy testing and had that done 3/10/2022. This was negative. He was finally able to be seen by Dermatology on 5/12/2022 who determined his rash was secondary to the Covid vaccine.

Past drug history included: Phenergan, reaction(s): "Known allergies: Phenergan", notes: Phenergen; Morphine, reaction(s): "Known allergies: Morphine", notes: Morpheme; Demerol, reaction(s): "Known allergies: Demerol"; Codeine, reaction(s): "Known allergies: codeine". The following information was reported: VACCINATION FAILURE (medically significant), COVID-19 (medically significant) all with onset 2022, outcome "recovering" and all described as "Treatment of COVID-19". The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: (20Jul2022) Positive, notes: Testing positive with home test still (20Jul2022); (06Jul2022) Positive, notes: Tested positive on 06Jul2022(symptomatic for several days prior to positive test). Therapeutic measures were taken as a result of vaccination failure, covid-19. Clinical course: Tested positive on 06Jul2022 (symptomatic for several days prior to positive test). First dose in evening on 06Jul2022. Felt better (15Jul2022) then on 186Jul2022 got fever, chills, sweats, congestion, scratchy throat, exhaustion, diarrhea. Never checked if patient tested negative ever but testing positive with home test still (20Jul2022). Fever gone but still congested, very tired, general malaise, sweats. During this time, my lingering cough/lungs have continued to clear well, though. The patient received Paxlovid from 05Jul2022 to 11Jul2022 for treatment of COVID 19.

Write-up: 01/01/2022 I noticed my menstrual cycle was incredibly heavy. My cycle would last 4-5 days and was heavy. This continued for four months. I went off my birth control in February because my cycle was so heavy. I made a doctor appointment for May. The doctor informed me that other women have had the similar thing happen. I went from having very heavy cycles and being on schedule. To having no periods in June and July. My pap smear and exam were normal. I have not had COVID.

Write-up: Patient"s parent called today at 12:30pm, explaining that he had just witnessed the patient have either a fainting or seizure spell. Patient had been drinking carbonated soda, complained of chest pain, and had an episode where their eyes rolled to the back of their head and either fainted or seized. Parent is unsure. Patient is currently alert and oriented, talking, no lasting effects, no lasting verbal, sight, or motor issues. Suspected delayed syncope. Have not

reported to hospital, and patient does not currently have an active primary care doctor. Expressed that if anything else happens to reach out to EMS or go to hospital for follow-up. Patient should be watched in-house for further issues if they decide to continue with second dose.

Write-up: This is a literature report for the following literature source(s): "Acute vulvar ulcers and the COVID-19 booster vaccine", Case Reports, 2022. The authors presented a case of a 22-year-old patient who presented with acute vulvar ulcers that developed 2 days after they got the COVID-19 Pfizer booster. While these ulcers have historically been identified after a variety of triggers, more recently, reports have been made following the COVID-19 vaccination and infection. Here, they have identified a case following a Pfizer booster dose. Case Report: A 22-year-old adult presented to the dermatology clinic with an 11-day history of vulvar ulcers. The patient reported tenderness and swelling of the labia initially and subsequently noticed discrete, deeply erythematous lesions. These gradually coalesced into gray, tan exudates and pseudomembranous with continued extensive vulvar swelling. The patient also noted severe pain, particularly with urination, a fever, and axillary and supraclavicular lymphadenopathy with ulcer onset. Two days prior to symptom onset, the patient had received the Pfizer COVID-19 booster vaccine and had a negative COVID polymerase chain reaction test after the booster. The patient reported a history of 2 similar episodes, at age 13 years and approximately 6 months prior to presentation. The first episode was presumed to be trauma secondary to shaving, although they denied any history of shaving. The second episode was preceded by a viral upper respiratory illness. The patient noted a history of oral aphthous ulcer outbreaks 3 times per year. They denied any vaginal intercourse for over 2 years, new medications, personal care products, or inciting trauma. Testing for human immunodeficiency virus (HIV), gonorrhea, and chlamydia was all negative in the past and on repeat testing. Their recent pap smear was unremarkable. Prior to presenting to dermatology, the patient saw infectious disease and was prescribed amoxicillin/clavulanate, doxycycline, and fluconazole as empiric therapy. A punch biopsy of the right labia minora showed epidermal ulceration with dense dermal mixed inflammation and favored an infectious etiology. Bacterial vulvar tissue culture and smear showed neutrophils and moderate mixed gram-positive organisms. Serologic testing revealed herpes simplex virus (HSV)-1 IgG. HSV-2, HIV, acid-fast bacilli, varicella zoster, hepatitis B, hepatitis C, cytomegalovirus, and syphilis testing were all negative. On examination, no oral ulcers were present, but vulvar edema and extensive ulceration were present bilaterally (left worse than right), with yellow, gray purulent drainage and pseudomembrane. A second punch biopsy of nonulcerated skin and tissue culture of the left vulva was completed. The patient was advised to continue oral antibiotics and to empirically start mupirocin and clobetasol ointment twice daily. The second punch biopsy of the left vulva showed dermal edema with vascular ectasia and sparse chronic inflammation and no

signs of bacterial or fungal organisms. Tissue culture results showed Escherichia coli and rare candida, which were interpreted as asymptomatic colonization from GI/ GU flora. Antinuclear antibody, Epstein-Barr virus panel, Lyme, and thyroid cascade were negative. C3 and C4 complement were mildly elevated at 181 and 50, respectively, though noted to be insignificant. Approximately 1 week later, they noted improvement with topical clobetasol, but persistent pain. The patient started 60-mg oral prednisone with a 15-day taper. Two weeks after their first appointment, they noted improvement in discomfort and treatment was continued with prednisone taper, clobetasol ointment, and the mupirocin ointment. The patient was counseled that this may recur in the future. Discussion: This case of acute vulvar ulcers in a 22-year-old adult 2 days after receiving the COVID-19 Pfizer booster vaccine adds to the evolving compendium of COVID-19 vaccine related adverse reactions. Sender"s Comments: Based on the known safety profile and information in the case report a casual association between reported event Vulval ulceration and the suspect drug BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate

Write-up: swollen lymph nodes; stomach pain; irritability; my sense of taste and smell is gone after the 2nd shot; my sense of taste and smell is gone after the 2nd shot; Overall declined in health; joint pain; chest pain; Inappropriate schedule of vaccine administered; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP) from medical information team. The reporter is the patient. A 52-year-old male patient received BNT162b2 (BNT162B2), on 30Dec2021 as dose 2, single (Lot number: 33025BD) at the age of 52 years, in left deltoid for covid-19 immunisation; influenza vaccine (INFLUENZA VACCINE), in 2021 as dose number unknown, single (Batch/Lot number: unknown) for immunisation. The patient''s relevant medical history included: "COVID-19" (unspecified if ongoing), notes: Had COVID 6 weeks before being forced into getting first shot. There were no concomitant medications. Vaccination history included: BNT162b2 (DOSE 1, SINGLE; LOT: 32030BD; NDC, EXP: Unknown; Anatomical site of vaccination: right deltoid), administration date: 23Oct2021, when the patient was 52-year-old, for COVID-19 Immunization, reaction(s): "Overall declined in health since he was forced to get these shots". The following information was reported: INAPPROPRIATE SCHEDULE OF PRODUCT ADMINISTRATION (non-serious) with onset 30Dec2021, outcome "unknown", described as "Inappropriate schedule of vaccine administered"; CHEST PAIN (non-serious) with onset 31Dec2021, outcome "not recovered"; ARTHRALGIA (non-serious) with onset 31Dec2021, outcome "not recovered", described as "joint pain"; LYMPHADENOPATHY (non-serious), outcome "not recovered", described as "swollen lymph nodes"; ABDOMINAL PAIN UPPER (non-serious), outcome "not recovered", described as "stomach pain"; IRRITABILITY (non-serious), outcome "not recovered"; AGEUSIA (non-serious), ANOSMIA (non-serious), outcome "not recovered" and all described as "my sense of taste and smell is gone after the 2nd shot"; GENERAL PHYSICAL HEALTH DETERIORATION (non-serious), outcome "unknown", described as "Overall declined in health". Therapeutic measures were taken as a result of arthralgia. Therapeutic measures were not taken as a result of chest pain. Additional information: The patient was treated with 300 mg Acetamenophen for arthralgia, which he takes when he aches so bad he can''t stand anymore. The patient wants to know how long the side effects will last. He states he "was pretty much experiencing all of them". 9 months and he was getting joint pain chest pain, swollen lymph nodes, stomach pain, irritability, its all still there. Overall declined in health since he was forced to get these shots. He had tried to follow up with them (HCP) they just dont want to know nothing about it, they cant tell him anything, they said he would be all right. They keep telling him the shot was safe". Caller stated that he was wondering the longevity of the side effects. He also noted that he really truly wish he had never been poked. Caller also reported having lost his sense of taste and smell after the 2nd shot. Sense of taste and smell is pretty much gone: Started right after he got the shot. Sense of taste and smell came back after that and was pretty good and everything was normal. Everything was pretty good after being forced to take first shot. Pretty much as soon as he got second shot, sense of taste and smell were completely gone again. Patient was still experiencing chest pain now, all day long, every day. Sometimes are a little worse than others. Joint pain was still the same. Has arthritis, which has excelled since he has

gotten that shot. Has been real bad since then. Caller stated that these side effects have been ongoing for 9 months. No visits of emergency room and physician office. No prior vaccinations within 4 weeks. No AEs prior vaccinations. No Family medical history relevant to AEs

Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC202201118272
Write-up: Overall declined in health since he was forced to get these shots; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP) from medical information team. The reporter is the patient. A 52-year-old male patient received BNT162b2 (BNT162B2), on 23Oct2021 as dose 1, single (Lot number: 32030BD) at the age of 52 years, in right deltoid for covid-19 immunisation; influenza vaccine (INFLUENZA VACCINE), in 2021 as dose number unknown, single (Batch/Lot number: unknown) for immunisation. The patient''s relevant medical history included: "COVID-19" (unspecified if ongoing), notes: Had COVID 6 weeks before being forced into getting first shot. There were no concomitant medications. The following information was reported: GENERAL PHYSICAL HEALTH DETERIORATION (non-serious) with onset 2021, outcome "not recovered", described as "Overall declined in health since he was forced to get these shots". Additional information: The patient did not have any family medical history relevant to the adverse event. The patient received first shot at mass medical event through battalion. The patient had COVID 6 weeks before being forced into getting first shot. Sense of taste and smell came back after that and was pretty good and everything was normal.

Everything was pretty good after being forced to take first shot. The patient had overall declined in health since he was forced to get these shots. The patient wanted to know how long the side effects would last. The patient stated that he was wondering about the longevity of the side effects. No investigations were done. The case was reported as non-serious.

Current Illness: Patient stated that she had chest pain prior to getting the vaccinations.
Preexisting Conditions: Unknown, patient stated she is generally healthy.
Allergies: No known allergies
Diagnostic Lab Data: N/A
CDC Split Type:
Write-up: Patient received both vaccinations, exited the vaccination room and then immediately began complaining that she was feeling lightheaded. She was very flushed and appeared to be in distress. She re-entered the vaccination room where she appeared to have significant back pain and continued lightheadedness. She was able to lie down more comfortably on the floor and rested while EMS was contacted. She complained of some chest pain and stated she had chest pain prior to the administrations of the vaccines. EMS arrived within 15 minutes, assessed the patient and transported her to the local hospital.

Current Illness: None
Preexisting Conditions: Eczema, depression
Allergies: Peanuts
Diagnostic Lab Data: None
CDC Split Type:
Write-up: I began to experience a tightening sensation in my throat about 5-10 minutes after the vaccine injection. I was worried about getting stuck at the pharmacy or forced to visit the hospital so I went home, where my throat continued to constrict and my voice became hoarse. I called the pharmacy and they recommended Benadryl. I took one 25mg Benadryl (~5:00pm) which helped, but my throat began to tighten again about 1 hour later so I took another Benadryl (~6:00pm), and then 1 more Benadryl 3 hours later before I went to bed at 10pm. This resolved the tightening in my throat and hoarse voice. This reaction was similar to the anaphylactic reaction I experience when I?m exposed to peanuts. It would have been smart to go to the hospital, but I did not want to incur the cost.

Diagnostic Lab Data:
CDC Split Type: US0095075132208USA011085
Write-up: this patient was exposed to COVID-19 on an unspecified date.; After that first dose, the patient experienced "superficial numbness in her left arm" (where the dose was administered); She is "very sensitive to vaccines."; Patient received her first dose of GARDASIL 9 at age 25 years / The patient is now currently 39 years old and received her 2nd dose; This spontaneous report was received from a pharmacist regarding a 25-year-old female patient. The patient''s medical history, concurrent conditions, and concomitant therapies were not reported. On an unknown date (reported as "at age 25 years"), the patient was vaccinated with the first dose of hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9) (dosage regimen, strength, lot #, expiry date, anatomical location, and route of administration were not provided) as prophylaxis. On an unknown date (reported as "after that first dose"), the patient experienced superficial numbness in her left arm (where the dose was administered) (Injection site hypoaesthesia). On an unspecified date, she was exposed to Coronavirus disease 2019 (COVID-19) (Exposure to COVID-19). In approximately June 2022 (reported as "approximately 2 months ago"), the patient was vaccinated with the second dose of hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9) (dosage regimen, strength, lot #, expiry date, anatomical location, and route of administration were not provided) as prophylaxis (Inappropriate schedule of product administration). Therefore, the patient stated that "she was very sensitive to vaccines" (Hypersensitivity). She was treated for the events. At the time of reporting, the patient was not recovered from the event of injection site hypoaesthesia. However, the outcome of the events

exposure to COVID-19 and hypersensitivity was not provided. The causal relationship between hypersensitivity and hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9) was related. However, the causal relationship between exposure to COVID-19, injection site hypoaesthesia, and hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9) was unknown.

Write-up: 1st dose on 13Jun2022, 2nd dose on 27Jun2022; This case was reported by a pharmacist via call center representative and described the occurrence of drug dose administration interval too short in a 61-year-old female patient who received Herpes zoster (Shingrix) (batch number 299J9, expiry date 1st July 2023) for prophylaxis. Concomitant products included RECOMBINANT VARICELLA ZOSTER VIRUS SURFACE GLYCOPROTEIN E (SHINGRIX). On 27th June 2022, the patient received the 2nd dose of Shingrix. On 27th June 2022, unknown after receiving Shingrix, the patient experienced drug dose administration interval too short. On an unknown date, the outcome of the drug dose administration interval too short was unknown. Additional Information: GSK Receipt Date: 09-SEP-2022 Reporter''s Comment: The patient was not immunocompromised. At the time of reporting, the dose had not been repeated. The reporter consented to follow up. Additional Supportive Information: The patient received the 2nd dose of Shingrix earlier than the recommended schedule, which led to shortening of vaccination schedule.

CDC Split Type:
Write-up: He got his vaccine, he was very agitated at night, could not sleep very well, he is hot inside. He woke up on Monday with a temperature around 100 up and down, and then the third day for about 12-14 hours did not feel bad, but then yesterday afternoon he ran a fever again around 100 and last night was 101. He has not taken anything for it. He has stayed hydrated. He has tried to contact the pharmacist and did not get through anything. He has made an appointment with his PCP to see him tomorrow. He is still feeling bad, and today his temperature is 101, varies from 100-101. He just does not feel good. He got all COVID vaccines and was down for about 48 hours and then up and going again. Gets the flu vaccine every year and has never had a problem with them.

Other Medications: LIPITOR; SYNTHROID; FLONASE; IMITREX; NEXIUM; multivitamin
Current Illness: N/A
Preexisting Conditions: N/A
Allergies: N/A
Diagnostic Lab Data: COVID-19, 08/01/2022, positive.
CDC Split Type: vsafe
Write-up: It started with fatigue, nasal congestion, fever for a couple of days of 101, and very mild sore throat for a couple days. I took an at home test and tested positive. The fatigue lasted for a couple of weeks. I also loss my sense of smell. I talked to my doctor and I decided not to take PAXLOVID.

Write-up: Treatment of COVID-19/COVID-19 Test: Positive; Treatment of COVID-19/COVID-19 Test: Positive; This is a spontaneous report received from contactable reporter(s) (Other HCP). An 82-year-old female patient (not pregnant) received BNT162b2, BNT162b2 omi ba.4-5 (BNT162B2, BNT162B2 OMI BA.4-5), as dose 4 (booster), single (Batch/Lot number: unknown) for COVID-19 Immunization; coviD-19 vaccine (COVID-19 VACCINE), as dose 1, single (Batch/Lot number: unknown), as dose 2, single (Batch/Lot number: unknown) and as dose 3 (booster), single (Batch/Lot number: unknown) for COVID-19 Immunization. The patient''s relevant medical history included: "MCI" (unspecified if ongoing); "anxiety" (unspecified if ongoing); "Depression" (unspecified if ongoing). The patient had no known drug allergies. Concomitant medication(s) included: LEXAPRO. The following information was reported: DRUG INEFFECTIVE (medically significant), COVID-19 (medically significant), outcome "unknown" and all described as "Treatment of COVID-19/COVID-19 Test: Positive". The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: Positive, notes: Treatment of COVID-19. Therapeutic measures were taken as a result of drug ineffective, covid-19 which included Paxlovid. The information on the batch/lot number for BNT162b2, BNT162b2 omi ba.4-5 has been requested and will be submitted if and when received.; Sender''s Comments: Based on the information currently available, a lack of efficacy with both vaccines in this patient cannot be completely excluded.

Diagnostic Lab Data: none
CDC Split Type:
Write-up: I went to bed @ 10pm and was very tired (overtired) and for that reason took two 500mg NOW Brand Valerian Root Herbal Supplement so I might sleep better that evening. Within 5 minutes of ingesting this dose, I was in bed and almost immediately began having (large) muscle spasms. I say large muscle as my arms and legs were jerking uncontrollably and it was not noticed in hands, fingers, feet, or toes. These spasms lasted approximately 30 minutes. I believe it was a good thing I had taken the Valerian and believe that the spams calmed once the

Valerian kicked in. I don''t believe the Valerian was the source of these Spasms. I have taken Valerian off on on over the years and several previous does from this bottle. I have never before (or since) experienced an episode like this. Had it continued more than 30 minutes, I would likely called medical response but waited it out in hopes that the Valerian would calm the spasms. Apparently, it did. I have been fine since. I''ve decided to report this as it was a very bizarre event for me and not one that I''ve ever heard of in relationship to Covid vaccines.

CDC Split Type:
Write-up: Pt received the vaccine and stated he didn''t feel well and went white, he said it had happened in the past when he got blood drawn. He then went unresponsive and stiffened up. I laid the patient down from the chair to the floor and grabbed the EpiPen to administer. Simultaneously I told the technician to call 911. As I was uncapping the epipen the pt came too and was confused why he was on the ground. The pt then got up, we called his wife over and he sat down in the chair. The wife and him were talking and I left the IMZ room, once I got back into the pharmacy the wife called me to come back over because he was unresponsive again. I got the epipen out again and was ready to administer and he came to again. Pt was still white and now very clammy and w sweaty. The EMS came and took his BP and HR. Pt refused to be transported, so the EMS left and the pt stayed seated a bit then left.

Diagnostic Lab Data: Nothing as of yet.
CDC Split Type:
Write-up: Initially fine post shot. Early afternoon I started to get a sore arm. Similar to past experiences. Then around 8:15 I was laying on the couch watching a movie and I could feel my heart beating fast in my chest. It was getting up to the 120s/130s, which is abnormal for me. I did start to then develop some mild chills, body aches, headache, and low grade fever. Only a couple degrees up from normal, but I felt feverish. At one point my heart rate spiked up to 168 just going to the bathroom. I almost went to ER but thought I"d wait it out since I didn"t have chest pain or shortness of breath etc. Over the next three days there has been improvement. It hasn"t gotten up that high again. My resting rate is a bit above normal. Sometimes it"s lower than normal. I most notice the spike when I"m up moving around. Depending on what I"m doing (nothing too strenuous) it can easily get up into the 120s and 130s. It jumps all over the place throughout the day, but is definitely above normal.

CDC Split Type:
Write-up: On Sept. 10, 2022 I received a bivalent covid booster shot at a pop-up clinic at High School to my left arm. The shot was immediately painful in my arm -- and much more painful than previous shots or boosters. The pain intensified in the days following the booster and spread to my shoulder. The pain has persisted ever since. I did not have any pain in my arm or shoulder prior to receiving the shot. I"m concerned that this is SIRVA. I went to my primary care physician today. She diagnosed frozen shoulder and prescribed a course of physical therapy.

Write-up: disrupted her quality of life; Body itching (disrupted quality of life)/that was very bothersome; This case was reported by a physician via sales rep and described the occurrence of generalized pruritus in a female patient who received Herpes zoster (Shingrix) for prophylaxis. On an unknown date, the patient received Shingrix. On an unknown date, unknown after receiving Shingrix, the patient experienced generalized pruritus and impaired quality of life. On an unknown date, the outcome of the generalized pruritus was recovered/resolved and the outcome of the impaired quality of life was unknown. The reporter considered the generalized pruritus and impaired quality of life to be related to Shingrix. Additional Information: GSK Receipt Date: 23-SEP-2022 Reporter''s comment: Physician had friend who received Shingrix first dose and experienced full body itching for 3 months that was very bothersome and disrupted her quality of life. Physician also stated that the patient looked at all possible causes and could only conclude it was due to vaccination with Shingrix. The patient did see physician multiple tirne for evaluation and treatment. The patient was afraid to get second dose of Shingrix and will not get second dose. The reporter consented to follow-up.

Write-up: I had chills, muscle ache, low grade fever of 99, chest congestion, and little bit of cough. These symptoms did not last long but I am tired today. I took a test at the doctor office but I wasn''t going to get the results until a couple days later. I ended up taking an at home test at home and it came up negative for COVID-19. I got my results back from my COVID-19 test I took at the doctor''s office and that one came back positive for COVID-19.

Current Illness: N/A
Preexisting Conditions: Hypothyroidism
Allergies: Latex
Diagnostic Lab Data: EKG on 10/05/2022 normal, no acute findings.
CDC Split Type: vsafe
Write-up: Around dinner time, 09/30/2022, I had a sore arm. Around 8:00 PM, my heart started racing. I started getting chills, body aches, headache, for a few hours. Around 1:00 AM, my heart was 168. I still have had an elevated heart rate. I am watching it from my smart watch. I have no doubt it is from the vaccine. I have had shortness of breath. Doctor did an EKG. Doctor agrees I''m having an immune response to the vaccine. I am getting married tomorrow. I took a walk yesterday, got my nails done, getting ready and I felt like my heart dropped. My face got very hot. All last night, I felt I was having palpitations. Every time I tried to fall asleep, I would get a rush of adrenaline in my chest, so I could not sleep. I have never had this before. I have so much to do today and I am still sick.

Concomitant medication(s) included: OXAZEPAM oral (1 capsule by mouth 4 times a day 15mg on that over 20 years) taken for anxiety. The following information was reported: VACCINATION FAILURE (medically significant), COVID-19 (medically significant) all with onset Aug2022, outcome "not recovered" and all described as "he was positive for Covid". The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: (Aug2022) Positive. Therapeutic measures were taken as a result of vaccination failure, covid-19 and treatment included Paxlovid form 08Aug2022 to 11Aug2022. Clinical course: Caller reported that her husband had went into the hospital 08Aug2022 because he fell and broke his ribs. While he was there, he was found to have Covid. He was then sent home. He had history of A-fib and was 75 years old, so he was placed on Paxlovid. Stated he only took the medicine for 3 days. When attempted for clarification on hospitalization dates and caller stated he first went in 08Aug2022. Went in around midnight and sent him home the next morning with 3 broken ribs. He was to be discharged to a nursing home, but the nursing homes required covid test and when they did it, they found out that he was positive for Covid and sent him home instead (as reported).

Write-up: Patient was fine immediately after his flu shot, has always tolerated them in the past he said and this was his second year getting the high dose according to our records. He went to go do his shopping and came back a few minutes later out of breath and in distress. He said he almost didn''t make it back he had sudden severe acute pain in his lower spine with numbness and had a hard time walking/breathing. I checked his BP it was 186/107 with pulse of 57, then 159/91 with a pulse of 48. We used a different machine after he had a while to sit and start feeling better/drink some water and it was 168/96 with pulse 51. I called his doctor''s office and let them know what happened.

Write-up: her husband had went into the hospital 08Aug2022 because he fell and broke his ribs; her husband had went into the hospital 08Aug2022 because he fell and broke his ribs; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP). A 75-year-old male patient received BNT162b2 (BNT162B2), on 30Aug2021 as dose 3 (booster), single (Lot number: FF2587, Expiration Date: 31Dec2021) at the age of 74 years for covid-19 immunisation. The patient''s relevant medical history included: "Atrial fibrillation" (unspecified if ongoing), notes: Atrial fibrillation diagnosed over 10 years ago. The patient''s concomitant medications were not reported. Past drug history included: Oxazepam for anxiety, notes: Patient has anxiety problem and was on oxazepam oxazepam:1 capsule by mouth 4 times a day 15mg on that over 20 years. Vaccination history included: BNT162b2 (DOSE 1, Lot: EN6203), administration date: 25Feb2021, when the patient was 73-year-old, for Covid-19 Immunization; BNT162b2 (DOSE 2, Lot: ER2613), administration date: 18Mar2021, when the patient was 73-year-old, for COVID-19 immunization. The following information was reported: FALL (hospitalization), RIB FRACTURE (hospitalization) all with onset Aug2022, outcome "unknown" and all described as "her husband had went into the hospital 08Aug2022 because he fell and broke his ribs". The patient was hospitalized for fall, rib fracture (start date: 08Aug2022, discharge date: Aug2022). The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: (08Aug2022) positive. Clinical course: Caller reported that her husband had went into the hospital 08Aug2022 because he fell and broke his ribs. While he was there he was found to have Covid. He was then sent home. He took Paxlovid for 3 days and then stopped the medicine because he became confused. He then went back to the hospital and more tests were done and his heart was out of control. The doctors couldn''t find anything wrong so they sent him home. A week and a half later he had some kind of breakdown and was confused and went back to the hospital. and he has been in and out since. He is now in a nursing home and she does not know if this is long Covid or a cause from the Paxlovid. Stated her husband is not mentally competent right now. Stated that she had open heart surgery and is trying to get better while all this is going on. Caller did not know the name of the physician who wrote the prescription. Stated he only took for the medicine for 3 days. she did not know if it was the Covid or medicine. Could not find anything else wrong and he was not getting better. Attempted clarification on hospitalization dates and caller stated he first went in 08Aug2022. Went in around midnight and sent him home the next morning with 3 broken ribs. He was to be discharged to a nursing home but the nursing homes

required covid test and when they did it they found out that he was positive for Covid and sent him home instead. When patient was admitted to the hospital on 12Aug2022 he had stopped the Paxlovid at that point. Hospitalization: 12Aug2022-19Aug2022 then went home for 2 weeks and then went back to the hospital 07Sep2022. Has not been home sent. He then went to a nursing home. Has been at a nursing home for about a week now. Caller then stated he was on a lot of medicines if it was drug interaction but he was only on Paxlovid for 3 days. Patient has anxiety problem and was on oxazepam 1 capsule by mouth 4 times a day, 15mg on that over 20 years. Caller then stated that they both had all the vaccines. Stated she was thankful Pfizer came out with something because she was scared she would have got sick or Covid would kill them.

CDC Split Type: vsafe
Write-up: My COVID-19 symptoms were very mild. It started on the 7th with a scratchy throat as if I was coming down with a cold. Next day I had a little sinus congestion which is normal. I tested positive on the 8th. I then had runny nose, sinus pressure, had the sensation that my arm hairs were standing up; my left leg then felt very heavy. Within 5 days all the symptoms had resolved. The sensation with the arm hairs and heavy leg also came after both the vaccines.

Write-up: when I went to administer the vaccine, the needle malfunctioned and the vaccine leaked down her arm completely. Pt said she did not feel any was injected, I agreed. We discussed and bc she is low risk and only 67 we decided to administer regular flu instead of senior in case any got in to her system. Pt is fine, this is just a formality b/c of the needle malfunction.

CDC Split Type: USGSKUS2022148310
Write-up: Expired Flulaval administered; This case was reported by a nurse via call center representative and described the occurrence of expired vaccine used in a male patient who received Flu Seasonal QIV Quebec (FluLaval Quadrivalent 2022-2023 season) (batch number 7K95C, expiry date 30th June 2022) for prophylaxis. Co-suspect products included flu seasonal

qiv quebec pre-filled syringe device (Flulaval Tetra Pre-Filled Syringe Device) injection syringe for prophylaxis. On 14th October 2022, the patient received FluLaval Quadrivalent 2022-2023 season and Flulaval Tetra Pre-Filled Syringe Device. On 14th October 2022, unknown after receiving FluLaval Quadrivalent 2022-2023 season and Flulaval Tetra Pre-Filled Syringe Device, the patient experienced expired vaccine used. On an unknown date, the outcome of the expired vaccine used was unknown. This report is made by GSK without prejudice and does not imply any admission or liability for the incident or its consequences. Additional Information: GSK Receipt Date: 14-OCT-2022 Reporter''s Comment: The case was reported by nurse. Nurse reported that patient inadvertently administered an expired Flulaval expiry date 30th June 2022 on 14th October 2022. Reporter did not consent to follow. Additional supportive information: As patient administered expired dose which led to expired vaccine used.

Write-up: could hardly walk to her bed; The patient adds that she thought she had long term COVID; had a bad reaction; very stiff; sneezy; felt so terrible; swelling where the injection went in; underarm pain / moving more toward her breast; had COVID; This spontaneous case was reported by a patient and describes the occurrence of GAIT DISTURBANCE (could hardly walk to her bed), FEELING ABNORMAL (The patient adds that she thought she had long term COVID), IMMUNISATION REACTION (had a bad reaction), MUSCULOSKELETAL STIFFNESS (very stiff) and SNEEZING (sneezy) in an 89-year-old female patient who received mRNA-1273 (Moderna COVID-19 Vaccine) (batch nos. 071F21A, 026A21A and 031M20A) for COVID-19 vaccination. The occurrence of additional non-serious events is detailed below. Concurrent medical conditions included Seasonal allergy and Migraine. Concomitant products included BOTULINUM TOXIN TYPE A (BOTOX) for an unknown indication. On 10-Feb-2021, the patient received first dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) 1 dosage form. On 10-Mar-2021, received second dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. On 02-Nov-2021, received third dose of mRNA-1273 (Moderna COVID-19 Vaccine) (unknown route) dosage was changed to 1 dosage form. In August 2022, the patient experienced COVID-19 (had COVID). On an unknown date, the patient experienced GAIT DISTURBANCE (could hardly walk to her bed), FEELING ABNORMAL (The patient adds that she thought she had long term COVID), IMMUNISATION REACTION (had a bad reaction), MUSCULOSKELETAL STIFFNESS (very stiff), SNEEZING (sneezy), FEELING ABNORMAL (felt so terrible), VACCINATION SITE SWELLING (swelling where the injection went in) and VACCINATION SITE PAIN (underarm pain / moving more toward her breast). The patient was treated with NIRMATRELVIR, RITONAVIR (PAXLOVID) for COVID-19 treatment, at an unspecified dose and frequency. At the time of the report, GAIT DISTURBANCE (could hardly walk to her bed), FEELING ABNORMAL (The patient adds that she thought she had long term COVID), IMMUNISATION REACTION (had a bad reaction), MUSCULOSKELETAL STIFFNESS (very stiff), SNEEZING (sneezy), COVID-19 (had COVID), FEELING ABNORMAL (felt so terrible), VACCINATION SITE SWELLING (swelling where the injection went in) and VACCINATION SITE PAIN (underarm pain / moving more toward her breast) outcome was unknown. DIAGNOSTIC RESULTS (normal ranges are provided in parenthesis if available): In August 2022, SARS-CoV-2 test: Positive. The patient had a bad reaction to it that night and was very stiff could hardly walk to her bed. There was also swelling where the injection went in had underarm pain. The patient still had it after all that time. It seemed to be getting worse. The patient had an ultrasound, but would have another one next week. It had gone on day after day after day. It seemed to be moving more toward her breast. The patient concerned that she would have cancer in the lymph nodes thought she had long term COVID. The patient had terrible headaches, wake up with heavy head, and was tired all the time. The patient felt going further in the lymph nodes and a slight feeling in her breast. The patient had a mammogram not that long ago, and there was nothing there. The

patient stated that her doctor could not help her. The patient went to a physician three times, and was even going in for another ultrasound. A couple of months ago in Aug 2022, had COVID. was sneezy, her head was stuffed up, and had temperature. The patient felt so terrible. No other vaccines given within 1 month prior to Moderna COVID-19 vaccine. The patient visited office to seek medical care. The patient did not experienced a similar event in the past. The events terrible headaches/ her head was stuffed up/wake up with heavy head, and is tired all the time and had temperature was subsumed under diagnosis of Covid.

Other Medications: unknown
Current Illness:
Preexisting Conditions: none reported
Allergies: none reported
Diagnostic Lab Data: none
CDC Split Type:
Write-up: Within 2 minutes of second vaccine (Fluarix) patient asked if she could sit on the floor stating "This sometimes happens to me with needles, I feel dizzy and need to sit" Immediately provided a space to sit on floor and assisted her to sit. She then laid down flat and was monitored for 5 minutes. No s/s of distress noted. After 5 minutes she was allowed to sit for 5 minutes at which time she stated "I feel much better", allowed to stand to determine if dizziness would return and monitored for an additional 15 mins while seated in a chair. Encourage to drink fluids and call provider if any further symptoms of concern. Was able to walk from clinic with no return of symptoms. Called patient on 10/26/22 to assess needs. States she was "a little tired last evening" but feels "fine" today. Denies any return of dizziness. Encourage to drink fluids and call provider if any further symptoms of concern.

Previous Vaccinations:
Other Medications: Concerta, Ritalin, CBD Oil, Probiotics
Current Illness: I tested positive for COVID in March of 2020 and was still dealing with Long-COVID. I also developed shingles in November of 2021 just before receiving my booster.
Preexisting Conditions: Autoimmune issues: Behcet''s Syndrome in my teens and twenties; Endometriosis that progressed to stage 4 before having excision surgery and hysterectomy in July of 2018.
Allergies: I didn''t have allergies to medications, food, or other products before receiving my vaccine. Shortly after receiving my second vaccine I began to develop food sensitivities that first manifested as GI distress in January 2021. Through the spring and summer of 2021, I also started to develop chronic stye infections in my eyelids and the corners of my mouth started to become chronically cracked. In August 2021, I developed an acute nut allergy. I received my booster on December 29th, 2021. Shortly after that my health changed significantly and I developed Oral Allergy Syndrome. No matter what food I ate, my lips and eyes would swell and itch.
Diagnostic Lab Data: There are no tests or lab results. Only my experience that isn''t able to be measured or tested.

CDC Split Type:
Write-up: My Long-COVID symptoms have progressed. My chronic fatigue has worsened, I get migraine headaches that I''ve never before had in my entire life, I experience word-finding difficulty, inability to concentrate, and brain-fog, I have chronic pain and aches that disrupt my daily life, I experience post-exertional fatigue to a high degree. I developed Mast Cell Activation Syndrome and Oral Allergy Syndrome which causes me to experience allergic reactions to most foods that manifests symptoms in my skin and GI tract. I started seeing a Naturopath MD over the summer of 2022 and am on a regimen of prescription medications and herbal supplements to try and get the MAST cells under control, but have experienced very little improvement so far.

The patient underwent the following laboratory tests and procedures: Body temperature: 100; Magnetic resonance imaging: Unknown Results. Therapeutic measures were taken as a result of anaphylactic reaction, pyrexia, vaccination site erythema, vaccination site induration, vaccination site pain, vaccination site eczema, chills, fatigue, arthralgia, myalgia. Clinical course: Consumer stated, she was vaccinated last night, and she had a fever of 100 that could probably be higher except am taking those Aspirin and paracetamol (TYLENOL) (Further clarified as treatment) her right arm where the vaccine was given was rock hard bit red it had eczema, and it was quite painful, and she was also having terrible fatigue, Joint pain, Muscle pain, Chills etcetera like very much reaction and the reason she wanted to report it because she had mast cell activation syndrome so, actually she was having almost anaphylaxis from this and she knew her reaction was far more severe than the people but she felt somebody had them because (Incomplete sentence). She did not have that information, but cancer institute might. no, she did not have it her doctor office might. She had cancer and Ehlers-Danlos syndrome and mast cell activation syndrome she had several, she had Angiosarcoma on her pancreas it was the type of cancer that was very rare. Right now yes, as well as her inhaler as Cromolyn sodium her had mast cell activation syndrome, so she was taking bunch of antihistamine and mast cell stabilization product because she was having such a severe reaction, so she did not have anaphylaxis (as reported). Consumer stated, "It was less then 24 hrs. Since I was given the vaccine.". The information on the batch/lot number for pneumococcal 20-val conj vac (dipht CRM197 protein) has been requested and will be submitted if and when received.

CDC Split Type:
Write-up: Patient requested a flu vaccination and the vaccine checklist was completed with the patient prior to administration. After the vaccinator had administered the influenza vaccine the patient then informed her that she remembered she had already received one. Patient was asked to wait at the clinic which she did for approximately 30 minutes. Staff contact the state health department for any further instruction. Patient was informed that she may have an increased likelihood of symptoms and if so to contact us with any concerns. Patient said she felt fine and left on her own accord. Phone follow up with patient on 11/3. Patient said did feel soreness in her arm but took tylenol and was fine. No further discomfort of symptoms.

CDC Split Type:
Write-up: Pt came to the clinic to get her Flu & Covid Bivalent vaccines. Immediately after the administration of the 1st vaccine (Flu), pt. started to feel lightheaded and nauseous. She was transferred to a wheelchair and then to a cot to lay down. She was offered water/snack and vitals monitored. She advised she felt a bit anxious before coming in for the vaccines. Pt wanted to proceed with her 2nd vaccine (Pfizer Bivalent). That was administered at 1455 with no troubles. Pt was monitored for approximately 25 minutes after her last vaccine, and she advised she was feeling back to normal. Vitals all were within normal limits during the duration.

Write-up: Treatment of COVID-19; Treatment of COVID-19; Covid symptoms were in my chest; exhaustion; This is a spontaneous report received from contactable reporter(s) (Consumer or other non HCP). The reporter is the patient. A 65-year-old female patient (not pregnant) received BNT162b2 (BNT162B2), on 15Mar2021 at 15:45 as dose 1, single (Lot number: EP7533), in right arm, on 15Apr2021 as dose 2, single (Lot number: EW0169), in right arm, on 22Oct2021 at 14:00 as dose 3 (booster), single (Lot number: FH8020), in right arm and on 15Jun2022 at 13:00 as dose 4 (booster), single (Lot number: FM7553) at the age of 65 years, in right arm for covid-19 immunisation. The patient''s relevant medical history included: "back fusion" (unspecified if ongoing); "Known allergies: sulfa" (unspecified if ongoing); "Known allergies: lactose intolerant" (unspecified if ongoing). Concomitant medication(s) included: ALENDRONATE SODIUM, start date: 19Jul2021 (ongoing). The following information was reported: CHEST DISCOMFORT (non-serious) with onset 2022, outcome "unknown", described as "Covid symptoms were in my chest"; VACCINATION FAILURE (medically significant), COVID-19 (medically significant) all with onset 2022, outcome "unknown" and all described as "Treatment of COVID-19"; FATIGUE (non-serious) with onset 2022, outcome "unknown", described as "exhaustion". The patient underwent the following laboratory tests and procedures: SARS-CoV-2 test: (2022) Positive, notes: Indication=Treatment of COVID-19. Therapeutic measures were taken as a result of vaccination failure, covid-19. Clinical course: Patient received other medications in two weeks. Patient received Covid-19 treatment with Paxlovid from 13Oct2022 to 18Oct2022. Six days after completing patient final dose of Paxlovid, She had a "rebound". Patient original Covid symptoms were in her chest, exhaustion. Patient rebound was an intense head cold, exhaustion, dizziness. She felt worse during the rebound and it took over 10 days to recover - 10 days in addition to the 10 days of original Covid. Infrequently, Patient still become light headed.

Write-up: Registration noticed a dose on 9/15/2022 and it was logged as a Bivalent Booster. The patient was questioned if her dose on 9/15/2022 was a Bivalent Booster and she advised no it was not. Registration proceeded to move forward with the paperwork for Pfizer Bivalent Booster. When data entry was logging the dose in immunization registry they noticed a Bivalent dose already logged and brought it to management''s attention. After reviewing, patient did in fact receive a 2nd Bivalent dose, first dose on 9/15/2022 LOT # GH9702. All staff present today were reminded to triple check doses administered after 9/7/2022 and to ask management if any questions.

Other Medications: Too numerous to list, contact me directly if needed.
Current Illness: I have long haul covid.
Preexisting Conditions: Dysautonomia, hypermobile ehlers danlos, primary lymphedema and many other health conditions. Contact me for more information if needed.
Allergies: Too numerous to list, contact me directly if needed.
Diagnostic Lab Data:
CDC Split Type:
Write-up: The vaccine triggered a large increase in my lymphedema starting at the end of day 3. My entire body (under my arms, my sides, my upper and low legs) filled with fluid and I have needed repeated drainages from my lymphedema therapist to deal with this. It is now a month later and I am still dealing with this problem. This is absolutely caused by the vaccine as I have not had issues like this before except during the pandemic shutdown when I could not receive treatment for several months. There was no warming about in increase in lymphedema symptoms publicized about the bivalent vaccine so I did not have a chance to discuss this with my medical providers. My providers are now concerned about me receiving another booster. I already had dysautonomia before getting covid, and now have long covid and the vaccines were very important to me, but I am afraid to get another one.
