Write-up: This spontaneous report as received from a healthcare worker refers to unknown number of patients of unknown age. The unknown number of patients had received ZOSTAVAX (lot number not provided) and VARIVAX (lot number not provided) doses which were exposed to -6.8C for 1.5 hours every 24 hours due to defrost cycle every day. No adverse effect reported. It was unspecified if the patients had sought medical attention. The health care professional contacted during telephone follow-up did not remember which patient might have received these vaccines and could not supply the following information: patient name, date of birth, dates of vaccination, or lot number. She also stated that the vaccines have been moved to a proper storage unit. Follow-up information received from the healthcare worker. Patient information was updated. On 06-AUG-2013 the patient was vaccinated with a dose of improperly stored ZOSTAVAX (lot#, expiration date and route not reported). Additional information has been requested.

Write-up: This spontaneous report as received from a consumer refers to a 73 year old male patient with no pertinent medical history. On 22-SEP-2013 the patient was vaccinated with a dose of PNEUMOVAX23 and a dose of influenza virus vaccine (manufacture unknown) in the same arm (dose number, dose, frequency, route and lot# not reported). On the same day, the patient

received his allergy shots (manufacture unknown) in his other arm (dose number, dose, frequency, route and lot# not reported). After receiving PNEUMOVAX23 and influenza virus vaccine (manufacture unknown) in the same arm, on an unknown date in 2013 the patient experienced pain and swelling at the injection site. The patient also experienced some itching after receiving allergy shots (manufacture unknown). The patient did not receive any treatment and any lab diagnostic studies. The patient also did not seek any medical attention. On an unspecified date, the outcome of all events was reported as recovered on therapy. The patient was not reintroduced. The patient reported TYLENOL, OXYCONTIN and oxycodone did not work for him and he was allergic to them. The patient was also allergic to heparin. Additional information has been requested.

CDC Split Type: WAES1310**USA**009703
Write-up: This spontaneous report as received from a healthcare worker refers to unknown number of patients of unknown age. The unknown number of patients had received ZOSTAVAX (lot number not provided) and VARIVAX (lot number not provided) doses which were exposed to -6.8C for 1.5 hours every 24 hours due to defrost cycle every day. No adverse effect reported. It was unspecified if the patients had sought medical attention. The health care professional contacted during telephone follow-up did not remember which patient might have received these vaccines and could not supply the following information: patient name, date of birth, dates of vaccination, or lot number. She also stated that the vaccines have been moved to a proper storage unit. Follow-up information received from the healthcare worker. Patient''s information was updated. On 10-SEP-2013 the patient was vaccinated with a dose of improperly stored ZOSTAVAX (lot#, expiration date and route not reported). This is one of the several reports from the same source. Additional information has been requested.

CDC Split Type:
Write-up: The events which precipitated this report were a shingles vaccine administered on September 30, 2013 followed by the 2013 flu vaccine administered 10 days later on Friday October 11, 2013. The shingles vaccine resulted in absolutely no immediate after effects, as was also true of the flu shot. However, on the evening three days after the flu shot, I became seriously itchy, primarily around the beltline, not like the typical shingle symptoms which I understand are generally on one side of the body. Resorted to hydrocortisone ointment which I had on hand which calmed the itch down enough to enable sleep. The itch persisted from Sunday evening until Tuesday morning and on Monday evening there was a distinct rash on front of the upper right thigh. I continued with the hydrocortisone through this roughly 36 hour period. To my amazement and relief, upon awakening Tuesday morning, the itch and the rash were gone and there have been no further problems to date. Was the itch and rash following the flu shot caused by an interaction between and should a longer period of time been allowed to pass between to the two vaccinations?

CDC Split Type: 2013SA118114
Write-up: Initial report was received on 07 November 2013 from a non-health care provider from an unverified internet source. The reporter for this case is the same as case number 2013SA114788. A 7 year-old female patient (date of birth not reported) had received an Influenza vaccine (manufacturer, lot number, route, site and date of administration not reported) at her annual checkup. The patient was reported to have no pre-existing health conditions and was a very healthy child. The patient developed a severe headache and fever one day after vaccination. Three days later, the patient stopped breathing and died without warning in her mother''s arm. Diagnostic and laboratory testing were not reported. No further details were available at the time of the report. The patient''s outcome was fatal. Documents held by sender: None.

CDC Split Type:
Write-up: Patient received influenza vaccine on 11/20/13 at a flu clinic for employees staffed by nurses from another facility. Patient called facility the next morning to report that she woke up with an "itchy rash" on her chest and face. She denied any difficulty breathing or shortness of breath. Patient was encouraged to take a Benadryl and contact her PCP. The Lead RN contacted the patient x 2 on 11/21/13. Pt. reported that she was at work and that the symptoms had not worsened and she had not taken any Benadryl. She had contacted her PCP and was awaiting a return phone call. She continued to deny shortness of breath/difficulty breathing and no emergent care was deemed to be necessary.

Preexisting Conditions: None
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Pt having angioedema (rear of tongue), complained of tightness in throat. Pt has had idiopathic angioedema in past. The patient came back approximately 10 minutes after I gave her the shot and said she was having angioedema (specifically tongue swelling toward the back of tongue) and that she felt like her throat was closing. She did not have swelling, redness or warmth at site of injection. She said she had had angioedema in the past and said that her doctor said when she had it to use an epipen but did not have one. She stated that last year she got a localized reaction last year when she got a flu shot but attributed that to "the person giving the

shot" I administered epinephrine 0.3 mg into the muscle of right thigh. Pt said she thought swelling had gone down and was feeling better. Pt stayed in area with me for approximately 20 minutes so I could assess whether or not shot working. Declined ambulance/ driving her home. Epipen lot 2mg670 exp 5/14.

Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient was given SC ZOSTAVAX, appeared to be doing fine while sitting in waiting area for other prescriptions. After approximately 10 mins she came to pharmacy counter to pay for prescriptions. She suddenly became confused, then unable to talk or stand. With her son''s help she was lowered into a chair. She remained unresponsive but with visible and audible breathing for several minutes. During this time, 911 was called and an ambulance was activated. Eventually, patient was slowly able to regain consciousness and begin talking. She denied any signs of allergic reaction such as itchiness, facial swelling, or difficulty breathing. At that point, the patient and he son requested that the 911 call and ambulance be canceled. The son was comfortable with bringing her to her doctor''s office in his own car for her to be seen. Patient was helped out to her car. A follow up phone call to her home about a hour later found that she was doing okay with no recurrence of symptoms. She had discussed event with her doctor and made him aware.

Allergies:
Diagnostic Lab Data:
CDC Split Type: US2014GSK033320
Write-up: This case was reported by a nurse and described the occurrence of injection site pain in a 48-year-old female patient who received FLULAVAL QUADRIVALENT (batch number 9X3L3, expiry date 30th June 2015). Previously administered products included flu vaccine with an associated reaction of no reaction to previous exposure to drug. On 15th October 2014, the patient received FLULAVAL QUADRIVALENT. On 15th October 2014, 0 min after receiving FLULAVAL QUADRIVALENT, the patient experienced injection site pain. On an unknown date, the outcome of the injection site pain was not recovered/not resolved. It was unknown if the reporter considered the injection site pain to be related to FLULAVAL QUADRIVALENT. Additional information received: Nurse reported that a patient complained about pain in her arm and where she received the vaccine.

Rate: Westergren
CDC Split Type:
Write-up: My daughter has always been healthy with the exception of ear infections when she was younger. She played soccer, did cheerleading and currently dances twice a week. My daughter received her first dose of the Gardasil HPV vaccine on 7/22/14 and a second dose on 7/22/14. On 12/6/14 she woke up with a rash on her thighs, stomach, arms and back. We took her to the doctors and they diagnosed her with Pityriasis Rosea. On the evening 12/7/14 she started experiencing muscle pain and could barely walk on her legs. We took her back to the doctors on 12/8/14 and was told that she did not have Pityriasis Rosea and that what she most likely had was a virus. Her symptoms, rash and muscle pain, continued to worsen and we took her back to the doctors on 12/10/14. We were told that she appeared to have a viral infection and it needed to run its course. On 1/13/15 we took her back to the doctors as she was still having her rash, was tired all the time and was still having muscle pain her legs, arms and wrists. Weight loss also became a concern. On 12/8/14 weight was 110 pounds on 1/13/15 she was down to 99 pounds 8 ounces. Blood was drawn results were negative for mono, a weak positive for autoimmune, SED RATE

showed inflammation and positive for anemia. On 1/16/15 saw a dermatologist for a skin biopsy which came back as vasculitis. On 1/28/15 we saw a Rheumatoid Arthritis specialist who diagnosed her with undefined Juvenile Idiopathic Arthritis and prescribed her 125 mg Naproxen 2 times a day. As Naproxen was not working on 2/6/15 Prednisone was prescribed at 3 tablets of 10 mg of prednisone a day for 1 week, than 2 tablets for a week and then 1 tablet for a week. Follow up with RA specialist on 2/27/15. Continues to have rash and joint pain in her legs and arms. Was left on taking 10 mg of Prednisone daily and went for x-rays on wrist. Wrists x-rays came back good. On 4/1/15 follow up with RA specialist. Range of motion better in legs and arms. Still pain and limited range in both wrists. Steroid injection into joint of left wrist and Prednisone was reduced to 7.5 mg daily. As I am writing this on 4/19/15 she still is experiencing a rash on her legs, arms, stomach and back. The rash comes and goes. She is still having pain in her wrists more in the right as she had the steroid injection in the left. She is unable to put pressure or support her weight on her hands. There is once again a loss of range of motion in her right arm. She cannot straighten her arm as it hurts too much.

CDC Split Type:
Write-up: Patient stated that the her arm has a rash the size of a tea cup (the redness has gotten better) and has experienced pain in the arm which has not gotten any better. Patient did state that she had the chicken pox really bad as child when administering vaccine. Advised patient to take pictures of arm and if it does not get any better within the next 24 hours to contact her doctor or go

to ED. I did tell patient that a rash and pain is common but have not had anyone stress concern of large rash and severe pain. Patient said she would wait it out and see what happens. I told her to keep me posted and to call with any other questions.

CDC Split Type: 2015SA117498
Write-up: Initial unsolicited report received from a healthcare professional on 3 August 2015. A 59-year-old male patient had received a first dose of ADACEL (batch number, route of administration not reported) in right deltoid on 8 July 2015. The patient''s illness at the time of vaccination, pre-existing physician diagnosed allergies, birth defects, medical conditions were reported as none and concomitant medication were reported as none. On 17 July 2015, nine days after vaccination, the patient developed a red scaling rash that had spread starting from his head progressing to his face and then full trunk. It both itches and burns. The patient was diagnosed with pityriasis rubra pilaris. Reporter consider it as a life-threatening illness. The patient required ER visit. The patient had tried triamcinolone cream without success as corrective treatment and was concerned that this may lead to more serious physical conditions such as liver and spleen enlargement. The patient''s blood work is pending and he is being seen as a case at a symposium this week for evaluation and treatment. Laboratory investigations were reported as ''labs''. At the time of this report, the event outcome was not recovered. Documents held by sender: none.

Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Pt initially felt no pain when vaccine administered on Friday 10/9/15. Sunday 10/11/15 in the evening arm started to hurt. By Monday patient was in "agony" and saw physician. Pt said she couldn''t move her arm without pain at this time. Pain also sometimes radiates through shoulder into neck. MD prescribed muscle relaxant and Tylenol with codeine. Pt did not take Tylenol with codeine but did take muscle relaxant at night and took 600 mg of ibuprofen which she said helped. Spoke with patient on Wed 10/14 and again on Thurs 10/15/15. She said pain is getting lesser every day but still present somewhat. Advised massaging the muscle, moving it as much as possible and icing it if necessary.

CDC Split Type: 2015SA136221
Write-up: Initial unsolicited report received from a pharmacist on 05 September 2015. This case involves a 67-year-old female patient who was vaccinated with first dose of FLUZONE HD (batch number: UI428AB, expiry date: 19 March 2016) via intramuscular route in right deltoid on 03 September 2015. Reporter denied any illness at time of vaccination, pre-existing physician-diagnosed allergies, birth defects, medical conditions. Concomitant medications were not reported. On 05 September 2015, two days post vaccination, the patient developed redness at injection site, lump at site, warmth and red ring around injection site. Laboratory data and corrective treatments were not reported. At the time of this report, the outcome of the events was unknown. List of documents held by sender: none.

Current Illness: None
Preexisting Conditions: Sciatic; Allergy - NSAIDS OTC and prescription, Tramadol; KEFLEX, Clindamycin; Seasonal allergies; Codeine
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Employee flu, vaccine give left upper arm. Hurt a little as fluid injected, but seemed normal injection, achy as usual following day. With 1-2 days it continued to be nagging, but was

having spasms/tightness. After a couple of weeks spread to tightness in shoulder and neck, incorporated left shoulder blade. I first thought it would go away. Taking TYLENOL 2-3 x day since beginning, recently tried muscle relaxants; routine visit with chiropractor suggest PT and see PCP for continued spasms/tightening-$g saw PCP starting PT scan and PCP said I should call Employee Health.

The patient''s concurrent conditions, medical history or concomitant medications were not reported. On an unknown date, the patient received PNEUMOVAX 23 (strength, dose, route, site of administration, lot # and expiry date were not reported) and "it hurt". She additionally reported that injection of PNEUMOVAX 23 was painful for most patients. The outcome of adverse event was not reported. The causality assessment between adverse event and PNEUMOVAX 23 was not provided. This is one of several reports from the same source. Additional information has been requested.

CDC Split Type:
Write-up: Husband of client received IIV4 Flulaval at 2:25 pm on 1/6/16 during a clinic visit with wife and 4 week old infant. This client is a 36 year old male with no history of illness and no history of chronic illness. Client was asked all required and necessary questions regarding past experience with vaccinations, allergies to eggs and/or vaccine components. Client stated no negative events occurred from vaccinations, the last vaccination being a TD. This was his first flu shot he was receiving to protect his 4 week old daughter. Flulaval (Lot: AT3CC, NCD 19515-898-11), 0.5ml, was administered IM to right deltoid at 2:25pm. Fifteen minutes following vaccination with Flulaval client reports going into bathroom, feeling lightheaded, lowering himself to the floor and then vomited. He returned to office and then reported to another nurse that he had nearly passed out when he had a vaccination in the past. Vital signs were taken, 108/76, Pulse regular 80. Client appeared pale and was sat at table, provided a drink, and asked to remain in place for monitoring. At 3:30pm this client desired to leave with wife/baby reporting he felt better. His pulse was 80 regular. At time of event the Nursing Supervisor was informed and present for entire follow up monitoring. Client was advised at time of department from office to seek medical attention for further symptoms. A follow up telephone call was made to client at 4 pm, he was attempting to eat, but reports vomiting what he had eaten. This RN instructed patient to have wife drive him home, and to lay down.

Current Illness: None
Preexisting Conditions: None
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Redness and rash appeared on my forehead above the right temple 3 days after the (05/05/2016) shingles immunization; each day the rash developed slowly in size, slight bubbling, and very slight swelling; after 9 days, my right eye became very red, bloodshot, and a small bubble appeared on each of my eyelids; no itching was associated with the rash; on day 9, I also began infrequently to experience sharp pains shooting down the rash and into my eyelids; I treated the rash with bag balm for four days, but switched to Calamine lotion on day 10. It had a very effective drying impact on the skin and stopped the little weeping I was getting from slight pocks in my skin. Today I saw a physician and ophthalmologist who prescribed Prednisolone drops 2x/day for my right eye and Acyclovir 800 mg tablets 5x/day for shingles.

Current Illness: No
Preexisting Conditions: Penicillin
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Woke up, felt tired even after 8+ hours of sleep, and body ached all over. I normally have a good appetite in the morning, but was not feeling hungry and slightly nauseous. I ate 2 scrambled eggs, 1 piece of toast and some weak coffee. Despite feeling a general malaise with body aches and some lethargy, I went for a 2 mile run at a slow pace at 10:30 AM. Upon stopping from the run at 11:00 AM, I felt weak and my muscles and joints were in pain. At 12:00 PM I had to lay down, took my temperature and had a fever of 101.3. I felt like I might vomit at any minute, but did not. I slept until 1:30 PM at which time my temperature was now 102.8. I took 200 mg of Advil at this time. The fever went down to 101. I drank a lot of water, had some orange juice, fruit, and carrots and 5.5 oz of yogurt. I felt a bit better until about 5pm at which time my fever returned, the body aches and lethargy returned, and I took more Advil (400mg). At 11:15 PM I am feeling slightly better. I did not have a cold or any signs of ill health prior to the TDap vaccination.

Diagnostic Lab Data:
CDC Split Type: WAES1607**USA**005295
Write-up: This spontaneous report was received from a healthcare worker and refers to an unspecified number of patients of unknown age and gender. No information regarding the patients" pertinent medical history, drug reactions, allergies, or concomitant therapies was provided. On unknown dates, the patients were vaccinated with improperly stored doses of VARIVAX (lot # M004328, expiration date 26-JAN-2018, exact doses and route of administration were not reported). The reason of the call was temperature alarm received via Digital Data Logger. It was reported that the vaccines were exposed to temperature of 9.6 Celsius degrees for 1 hour before administration to the patients. No previous temperature excursion was reported. No adverse effects were reported. This is one of several reports received from the same source. Additional information has been requested.

Diagnostic Lab Data:
CDC Split Type: WAES1607**USA**005294
Write-up: This spontaneous report was received from a healthcare worker and refers to an unspecified number of patients of unknown age and gender. No information regarding the patient''s pertinent medical history, drug reactions, allergies or concomitant therapies was provided. On unknown dates, the patients were vaccinated with improperly stored doses of PROQUAD (lot # reported as M006105, expiration date 01-AUG-2017, exact doses and route of

administration were not reported). The reason of the call was temperature alarm received via Digital Logger. It was reported that the vaccines were exposed to temperature of 9.6 Celsius degrees for 1 hour before administration to the patients. No previous temperature excursion was reported. No adverse effect were reported. This is one of several reports received from the same source. Additional information has been requested.

Diagnostic Lab Data:
CDC Split Type: USSA2015SA208185
Write-up: Initial unsolicited report received from a non-healthcare professional on 07 December 2015. This case involves a 72-years old female patient who was vaccinated with a dose of FLUZONE HD (batch number: UI524AA, dose, dose in series and route of administration was not reported) in the left arm on 04 December 2015. The patient''s illness at time of vaccination, pre-existing physician diagnosed allergies, birth defects, medical conditions were reported as none and denied any other vaccinations within four weeks of vaccinations. The patient''s concomitant medications were not reported. On 04 December 2015, thirty minutes following the vaccination, the patient had developed metallic taste. Laboratory data and corrective treatment was not reported. On an unknown date, the patient was recovered from the event (after 1.5 day). List of documents held by sender: none.

Other Medications: Atorvastatin; Losartan; Levothyroxine; Clobetasol
Current Illness: No
Preexisting Conditions: Hypertension; Hyperlipidemia; Hypothyroidism
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: At approximately 3:00am on 10/04/16, patient awoke with her chest feeling heavy. She felt that her heart was beating heavily. She went back to sleep then awoke again shaking and feeling cold, heart still felt like it was beating fast/strong. She again fell back to sleep. She awoke at 6:00 AM(when she normally would prepare for work) but felt very tired and weak, her chest still felt heavy. She had recently (7/30/16) suffered a stroke so she was worried that something serious was happening. Her right arm at the site where she had received the PREVNAR 13 vaccine was red and raised. She measured her blood pressure and found it to be 144/102 (her usual reading would be 135/75), her heart rate was 113 (her usual was appx 70). She took her blood pressure medication and a low dose aspirin. She called 911. The EMT found her to have a low grade fever (100.3). She was given an EKG. She was told that she was having PVC''s at the rate of 1 every 5 seconds. Her blood work and stress test were normal. She had an elevated WBC which was expected due to her fever. Doctor diagnosed her to have had an adverse reaction to her PREVNAR 13 vaccine. Over time, (2-3 hours) she felt better and her symptoms went away. She was discharged.

Write-up: This spontaneous report was received from a healthcare worker and refers to unspecified patients of an unknown age and gender. No information regarding the patients" medical history or concurrent conditions was provided. On unspecified dates, the patients were vaccinated with an unspecified number of improperly stored doses of (Oka/Merck) VARIVAX injection (dose and route of administration were not reported; lot# L027287 and expiration date 21-JUL-2017). There were no concomitant therapies reported. The doses of (Oka/Merck) VARIVAX were stored at a temperature of -1.9 degrees Celsius for 7 hours and 30 minutes, on an unknown date. The doses of the vaccine were exposed to previous temperature excursion of -14 degrees Celsius for a time frame of 2 hours an -13.7 degrees Celsius for a time of 7 hours and 30 minutes (dates unspecified). A Digital data Logger was not involved. No adverse effects were reported. There was no product quality complaint involved. This is one of two reports received form the same reporter. Additional information has been requested.

Preexisting Conditions:
Allergies:
Diagnostic Lab Data: Test Name: Blood glucose; Test Name: Blood pressure
CDC Split Type: USPFIZERINC2016587046
Write-up: This is a spontaneous report from a contactable consumer reported for herself. A 77-year-old female patient received PREVNAR 13 via an unspecified route of administration at 0.5ml, single at the left arm and DTAP via an unspecified route of administration at 1 DF, single at the right arm, both on 23May2016 for immunization, received at the clinic. Medical history included ongoing blood pressure high diagnosed quite a long time before. Concomitant medication included atenolol oral 25mg tablet by mouth daily for years and ongoing for blood pressure high. The patient previously took TDap for immunisation. The patient received the PREVNAR 13 vaccine back in May2016 but soon after the injection she has been having and pain at the injection site in May2016. Two to 3 days after the injection, in May2016, she started to have a sharp pain in the left arm at the injection site. The sharp pain improved but continued to have discomfort and pain at the injection site with certain movement and 2 to 3 months before discomfort affected her writing. She discussed it with her doctor, the doctor did not think that it is due to the injection but the patient thought so. The outcome of the events was not recovered. The patient had blood test every 6 month to check for blood sugar and blood pressure. Her doctor assessed the arm to see if it was her rotator cuff and did not think it is her rotator cuff but recommended therapy. She had no problem with right arm.

Write-up: This spontaneous report has been received from a nurse practitioner (N.P) who was also the consumer reporting on her partner, a female patient of an unknown age. The patient''s pertinent medical history, drug allergies/reactions, or concomitant therapies were not reported. On 29-DEC-2016, the patient''s partner was vaccinated with ZOSTAVAX for the prevention of Herpez zoster (lot #, expiration date, dose, and route of administration were not reported). The patient''s partner reported that on 03-JAN-2017, the patient developed shingles (Herpes zoster). It was reported that on that day, the patient started with pain. On 05-JAN-2017, the patient went to an emergency room (ER) due to her pain. On 08-JAN-2017, she developed a rash and then sought medical attention from her primary care physician on an unknown date. The physician prescribed valacyclovir hydrochloride (VALTREX) and gabapentin (also reported as no treatment was given). The patient''s partner was thinking she might have transmitted the Herpes zoster to the patient. On an unknown date, the reporter accepted the varicella Zoster virus (VZV) packet. No product quality complaint was involved. The outcome of Herpes zoster was not reported. The causality assessment between Herpes zoster and vaccination with ZOSTAVAX was unknown. Additional information has been requested.

CDC Split Type: USPFIZER INC2017138013
Write-up: This is a spontaneous report based on the information received by Pfizer from Merck & Co., Inc. (Case Number: 00398291). A contactable pharmacist reported that a female patient of an unknown age and race received PREVNAR 13 at single dose on unknown date for immunization via an unspecified route of administration. Concomitant medications were not reported. The patient developed pneumonia on an unknown date, three months after administration of vaccine. Pharmacist reported the pneumonia was caused by complications of a heart attack; however, pharmacist was uncertain whether patient experienced the heart attack prior to or after administration of PREVNAR 13. The outcome of the event was unknown.; Sender''s Comments:

The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

Diagnostic Lab Data:
CDC Split Type:
Write-up: The nurse misread my daughters chart and administered the PCV-13 and Dtap-HepB-IPV (Pediarix) a second time in a three week period. She had received these two vaccinations on 5/23/17 and due to the nurse''s error, received them again 6/14/17. Because of this, my daughter had a higher than normal fever (102.3*F) caused by the vaccinations and remained irritable and fussy for over a week. Also, one of the vaccines was administered into her right thigh (not sure which one), but is mislabeled on her vaccine record.

Other Medications: Vitamin D, vitamin A, elderberry syrup, zinc
Current Illness: Nothing significant
Preexisting Conditions: None
Allergies: No known
Diagnostic Lab Data: Nothing yet. I''m monitoring him. Considering a MMR titer prior to redoing the MMR.
CDC Split Type:
Write-up: I received a call from the manager of the MD office, at 4:45 pm on July 12th, the day my son received the MMR vaccine. She informed me that patient may have received a vaccine incorrectly. She said that instead of using the proper diluent for the MMR, the person preparing the vaccine used a DTaP vaccine. She said they noticed the discrepancy when they counted their

doses and diluents. There were three children who received the MMR during that time span and patient was one of them. They already called Poison Control and she informed me the results of that. The office also reported it to the health department. I also spoke with Poison Control, the health department, and the CDC and learned to watch for a local reaction. They advised close monitoring but didn''t expect a significant reaction. They also informed me the vaccine needs to be repeated no sooner than a month from now as this injection is considered invalid. As of today, two days after the injection, my son seems fine. The injection site was warm for the first day, there was a small red area over a lump, and now the redness has disappeared and a lump remains. His mood and temperament is unchanged. He has not had a fever.

CDC Split Type:
Write-up: My son had his physical for school on 8/16/17 and was in excellent health. The doctor recommended we give him the HPV vaccine. We asked him about the safety of it and he said it was safe. That night he started vomiting a little. 8/17/17 he said his stomach was upset and he had pain in his legs, that evening he said his stomach was sore, and vomited more that night. 8/18/17 he woke up and said his stomach hurt, as soon as the doctors office opened we called and they said it was probably just a reaction from the vaccine and to bring him in at 1:00 in the afternoon. We were there for 2 hours, then he sent us to the ER. At 9:30 they removed his appendix which had burst and the surgeon said had been burst for a while. He is still in the hospital, and probably will be the rest of this week 8/20-8/26. And they said he probably won''t be able to start school next week. During his physical, the doctor felt and listened to his appendix and everything was fine. I mentioned several times to all the doctors involved during the last several days that he had the HPV vaccine and they were all saying it was unrelated, then I found a few documents stating that the HPV vaccine has directly caused appendicitis in .3% of cases. That information was not known to myself or the doctors, because when I showed them the information they said they never knew that. If we had known that possibility we would have called the doctor when his stomach first started hurting and the doctor probably would have sent us to the ER much earlier.

Write-up: Immediately after delivering dose, patients arm became swollen and red, about 1" circumference around the injection site. There were no systemic signs of allergic reaction/anaphylaxis, no disorientation or difficulty breathing, or swelling any other areas of the body that were noticeable to me. I asked her to stay in the store for 15 minutes, and swelling went down slightly, she then left with her mother to run an errand down the street, then cam back about 30 minutes later for me to check on her; again swelling was reduced to about 1/2" circumference and redness was minimal. I called again the morning of 9/27/2017- she states she is feeling slightly under the weather but that the swelling in her arm is less than it was last night.

CDC Split Type: US0095075131709USA014321
Write-up: This spontaneous report as received from a healthcare worker refers to a multiple unspecified number of patients of unknown age and gender. The concurrent conditions, medical history and concomitant therapies of the patients were not reported. On an unknown date, the patients were vaccinated with an improperly stored dose of ZOSTAVAX 19400 plaque-forming unit (PFU) (dose and route of administration were unknown) either lot # M041085 with expiration date of 31-JAN-2018 or lot number M044220 with expiration date of 03-JAN-2018 for prophylaxis, which were stored from -14 Celsius degrees (?C) to -10?C (-12.1 ?C) for 30 minutes. The healthcare worker was unsure if sterile diluent (strength, dose, route of administration, lot number and expiration date were unkonwn) used to reconstitute the ZOSTAVAX was properly stored. The temperature excursions were detected by a data logger. There were no previous temperature excursions. No adverse effects were reported.

Write-up: A classic shingles rash broke out several months after vaccination, but the interesting thing was where it started. The rash started exactly in the area where the injection was given, at the left upper arm, and spread down the forearm. Tingling and discomfort along the C8 dermatome. The patient is a board certified pediatrician and I am a retired pediatric nurse practitioner. We had the rash confirmed by a local MD.

CDC Split Type:
Write-up: Patient received a flu shot and PNEUMOVAX 23 in left deltoin, 1 inch apart on Thursday Oct. 5, 2017. That same evening her arm was sore so patient iced it and took ibuprofen for pain. Next day, upper right arm was more swollen. She continued with ice and ibuprofen. On Saturday Oct. 7, 2017 patient could not move her arm, whole circumference of upper right arm, below injection site was very red, and swollen and sore. Patient went to urgent care on 10/7/17 where she was advised to use topical hydrocortisone cream and allergy tablets. She was not given any antibiotics. On Wednesday Oct. 11, 2017 I saw the patient''s arm. The swelling and

soreness was gone. I followed up by phone conversation with the patient on 10/12/17 and the patient did not report swelling and felt better.

Previous Vaccinations: When I was very young, perhaps four, I reacted with a high fever and hallucinations to the TDAP (so my mother recalls). I do not
Other Medications: none
Current Illness: none
Preexisting Conditions: none
Allergies: none
Diagnostic Lab Data: On 10/5/17, I received the following tests: -EKG 12-LEAD -BASIC METABOLIC PANEL -D-DIMER -TROPONIN I All came back negative for any adverse heart conditions.
CDC Split Type:
Write-up: About 2 1/2 hours after the shot, I began having discomfort in my chest. I first thought it was heartburn (which I don''t typically experience, in fact, haven''t outside of pregnancy.) However, the feeling did not ease up. I went down to ask the school nurse if it could be a side effect of the shot, but as I walked, I began to get lightheaded. She checked my blood pressure and found it to be unusually high (180/90), but it lowered on a subsequent check to about 150/90 (still atypically high for me.) She suggested I get checked out. I went to the emergency room where they ran a series of tests that all came back negative (see below). All told, my symptoms included: -Tightness/discomfort in my chest - lasted about 8 hours -Difficulty swallowing (like a lump in my throat) - lasted about 8 hours -Shortness of breath - lasted about 8 hours -Redness in the eyes - lasted about 8 hours -My right eye was crusted shut two mornings later. Just that one morning. Two days after the shot, all symptoms had cleared up without treatment.

Other Medications: Lisinopril; Multi Vitamins; Aspirin
Current Illness: N/A
Preexisting Conditions: Hypertension
Allergies: N/A; We have added PNEUMOVAX 23 to allergy list
Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient was given PNEUMOVAX 23. Patient went home and a few hours later called in stating his arm had a softball size lump below the injection site. He came back to the office and we had given him ice and evaluated him. Patient was instructed to go home and take 2 BENADRYL before bedtime and put ice on the softball size lump. Patient came in the following day for follow up on injection site. Patients arm didn"t have the softball size lump but the swelling had moved down the inside of his arm and was slightly red. Patient was advised to keep an eye on the swelling and if anything else became worse to go to Urgent Care over the weekend.

Other Medications:

Current Illness: onset of rash
Preexisting Conditions: fibromyalgia, arthritis
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Headache, nausea, weakness, shakiness from about 4-5 days after immunization. Immunization date is estimated, as vaccination was administered at primary care office "about a month ago." Malaise persists and nausea is improved but persists. Since flu vaccination pt had 3 visits with different providers at primary care. Pt was told the rash was "not hives." Rash persists & she will go to dermatology today. Upon my request that practice submit a VAERS report, I learned there is no documentation of any adverse events, rash began before the vaccine was administered and other symptoms are not documented.

Other Medications: Did receive cortisone shot 2 days after
Current Illness: unknown
Preexisting Conditions: none
Allergies: none
Diagnostic Lab Data: none
CDC Split Type:
Write-up: Patient stated that a couple of days after he received the FLUARIX vaccine his face got bright bright red like a hot flash. This would come and go and lasted for approximately a week before it went away. Patient stated they had also received a cortisone shot within a few days of receiving FLUARIX. Patient stated they went in to see their doctor and the doctor thought it was most likely due to the flu vaccine. No treatment needed. Symptoms cleared up completely after

approximately a week. Patient stated they had never had a reaction like this to the flu vaccine.

Current Illness: none
Preexisting Conditions: none
Allergies: sulfa antibiotics
Diagnostic Lab Data: none as of yet.
CDC Split Type:
Write-up: Patient reported normal arm soreness the immediate days following vaccination. However the soreness developed into sharp pains when moving her arm. She gets a nauseating feeling during the pain. The pain is so bad that she has a hard time sleep on that arm during the night for it wakes her up. This developed within a week of getting the shot and has not abated. The patient does state it is starting to interfere with daily life. Patient does plan on following up this week with her primary care doctor.

Other Medications: Allegra D; Birth Control (generic for Ortho-tri-cyclin; Woman''s Multi-vitamin; Wellbutrin
Current Illness: None
Preexisting Conditions: None
Allergies: Ciprofloxacilin & Clindamycin Benzolyl
Diagnostic Lab Data: Physical Therapy started 11/13 and scheduled 2 days/week for a few

weeks to see if it will help. MRI scheduled for 12/12/17 if still in pain.
CDC Split Type:
Write-up: I have gotten the flu shot for years and usually have arm pain for a day or two after and then it subsides. This time the pain started in the afternoon of the shot and got so bad I couldn''t lift my arm. The pain did not go away within a few days and has proceeded to get worse 6 weeks later. My arm is weak, the pain is causing trouble sleeping for the past few weeks. I can''t lift my arm without pain and activities have been limited (including getting dressed and driving). The pain is in my upper arm that I got the shot in and started the afternoon of the shot. Pain is sometimes in muscle and others closer to the shoulder. I tried Aleve, Advil, Tylenol, etc but none helped. Went to my Primary care who recommended starting with physical therapy. If it''s not better I am scheduled for an MRI on 12/12. PMC said that the injection could have been too high in either the joint or bursa, but not 100%.

Previous Vaccinations:
Other Medications: WELLBUTRIN
Current Illness: no illnesses
Preexisting Conditions: M.S. (asymptomatic)
Allergies: AMOXIL, sulfa drugs, MACROBID
Diagnostic Lab Data: P.T. assessment reveals possible bursa damage from needle improperly inserted.; ortho appt on 11/28 for further details; Testing is ongoing and ortho visit pending, future MRI possible
CDC Split Type:
Write-up: Vaccine was administered higher on my arm than usual; first 24 hours/through the night arm was heavy and sore and continued through the next day. Pain settled deep into the shoulder joint. Range of motion restricted and painful--most acutely upon external rotation. Initial assessment by primary physician (10/19/17) dx as "frozen shoulder" and referred to Orthopedist (pending 11/28/17) and physical therapy (11/6; 11/10; 11/16). Two prescriptions of prednisone (20 mgx3; 8 days taper); nightly ice compress. Pain lessens when taking prednisone but otherwise can be excruciating; sleep interrupted by not being able to move without pain.

Write-up: The night of having the shot my arm was throbbing severely, couldn''t even sleep it hurt so much. Very swollen around the injection site also. After a few days the pain was gone but I have not felt right since having it. Very foggy brained and not feeling all there. And so run down and exhausted I cannot wake up. It has been a week now since having it and still feeling the same. A lot of all body muscle pain also.

Diagnostic Lab Data:
CDC Split Type: US0095075131711USA011910
Write-up: This spontaneous report was received from an immunization coordinator referring to a patient of unknown age and gender. No information about the patient''s medical history, concurrent conditions and concomitant medications was provided. On 27-NOV-2017, the patient was vaccinated with an improperly stored dose of ROTATEQ (lot # M043836 with an expiration date in 17-JUN-2018) orally for prophylaxis. The vaccine was exposed to temperature excursion of 28.1 degrees Celsius for 48 hours. Data logger was involved. There was no previous temperature excursion. No adverse effects were reported. Follow-up information has been received from the physician on 05-DEC-2017, referring to the 4 months old female patient. The patient had no brothers or sisters. There was no illness at time of vaccination. On 27-NOV-2017, the patient was vaccinated with ROTATEQ (lot # N005972). On the same day, the patient was vaccinated with other suspect therapies, including hib conj vaccine (unspecified carrier) (lot# UI804AA, intramuscular, at Right Vastus Laterali (RVL)), PEDIARIX (lot # 92443, intramuscular, RVL) and PREVNAR 13 (lot # S35326, intramuscular, Left Vastus Lateralis (LVL)). The vaccines later found to have been stored outside of accepted temperature range due to faulty thermostat on fridge. On the same day, upper respiratory infection (URI) was evident at time of Well-Child Care (WCC). The next day (on 28-NOV-2017), the patient had elevated temperature maximum 101 (unit not provided), vomited one time and had some diarrhea. The patient was fussier next few days, and developed cold symptoms. They did not want to repeat the vaccines but would continue as usual schedule. There was no prescription drug treatment for the experienced required. The outcome of the events was unknown. The causality between the suspect therapies and the events was unknown.

Allergies: Pravastatin (felt ill)
Diagnostic Lab Data: CT studies of the brain with and without contrast 12/25, 12/27, 12/28 and 12/29. MRI studies with and without contrast 12/25,12/29, 12/30 and 1/18. MRI venogram 12/26. Lumbar puncture 12/27. Multiple studies including cultures, PCR and antibody studies for wide variety of infectious agents (all negative), hypercoagulability studies, CSF ACE determination (normal), multiple hematologic, serum studies, all unremarkable. No etiologic agent for these events found except for proceeding immunization. No prior history of thromboembolic episodes for this patient or his family.
CDC Split Type:
Write-up: 12/7/2017 received immunization. 12/10/2017 noted right arm immunization site extremely sore and developed severe headache, nausea, vomiting, stiff neck, pain radiating down into right shoulder and arm especially with head movement. 12/13/2017 developed diplopia with

worsening of all symptoms. Around 12/23 experiencing global weakness, mental status changes, confusion, difficulties of concentration, speech and balance. Completely incapacitated by 12/25 when he presented to the emergency department. CT of brain completed with evidence of acute right cortical vein thrombosis. Transferred emergently to another Hospital. He underwent intensive workup confirming right posterior, parietal and frontal cortical vein thrombosis with associated subarachnoid and subdural inflammation with effusions. Left complete sixth cranial nerve palsy. Evidence of right cervical neuralgia. Hospitalized 12/25-12/31/2017. Symptoms slowly improving except for a sixth nerve palsy which is unchanged.

Diagnostic Lab Data: None
CDC Split Type:
Write-up: After 5 minutes of receiving the vaccination, the patient complained of a warm, tingly sensation at the site of injection (normal reaction) but then added that her lips felt numb, which was puzzling to me. After consulting drug reference materials and the package insert, there was no mention of "numbing" sensations. It was possible that she was experiencing an allergic reaction so I sat with her and kept her talking to keep her relaxed and calm. I then asked her specific questions regarding the areas of affect including "Does it feel as though your tongue is swelling" and "Have you noticed a change in your heart rate or breathing pattern?" She answered no to both of those questions. I had her remain seated for approx. 30min following the vaccination to watch for signs of worsening symptoms or anaphylaxis to which there were none. I had the patient stand up and she said she felt fine except for local pain at the injection site (normal) and the numb lips (abnormal). I let her go home and told her that if anything changed or worsened that she needed to call me or her PCP. Around 4:30pm or so, she had contacted her PCP''s office and talked with the Triage nurse who contacted me for more information. We then collaborated on possible reasons for her adverse reaction including her latex allergy (I wasn''t using latex gloves and all of the materials used in the vaccination were all latex-free) but ruled everything else out except for a generally mild (but alarming to the patient) allergic reaction. The Triage nurse then told the patient to report to the ER should she find her symptoms worsening or anything else that felt abnormal. The Triage nurse was then going to contact the patient in the morning to follow up. The following morning (2/9/18), the patient reported that she was fine and that everything was normal again.

Current Illness: Unknown
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type: US2018035471
Write-up: This case was reported by a consumer via call center representative and described the occurrence of weakness in a 57-year-old male patient who received SHINGRIX. Concomitant products included Levothyroxine and Mometasone Topical. On 28th February 2018 14:00, the patient received the 1st dose of SHINGRIX. On 28th February 2018 20:00, 6 hrs after receiving SHINGRIX, the patient experienced weakness, chills, fuzzy head and fatigue. The patient was treated with TYLENOL. On an unknown date, the outcome of the weakness, chills, fuzzy head and fatigue were not recovered/not resolved. It was unknown if the reporter considered the weakness, chills, fuzzy head and fatigue to be related to SHINGRIX. Additional details were provided as follows: The patient never had a reaction to any vaccine previously. The patient received SHINGRIX in the left deltoid. Three hours before the time of reporting, the patient took TYLENOL and he was feeling better.

Diagnostic Lab Data:
CDC Split Type: US0095075131802USA010985
Write-up: This spontaneous report was received from a pharmacist refers to a patient of unknown age and gender. The patient''s concurrent conditions, medical history, drug reactions and allergies were not reported. The patient''s concomitant medication was reported as sterile diluent. On 19-FEB-2018, the patient was vaccinated with expired dose of VARIVAX (dose, units and frequency not reported) (lot # M004328 and expiration date: 26-JAN-2018) subcutaneously. No adverse effects and no additional information was provided. No product quality complaint was involved. Follow-up information was received from a registered nurse on 01-MAR-2018. The reporter confirmed that the patient did not experience any redness, swelling or fever and that the medication error happened during the dispensing and administration processes. Additionally, the reporter stated that the adverse events were previously reported to the doctor as well as the manufacturer and reported the expiration date for VARIVAX as 24-JAN-2018 with no digital data logger involved.

CDC Split Type: US0095075131803USA004856
Write-up: Information has been received from a lawyer regarding a case in litigation concerning a female patient (age unknown). The patient''s medical history, concurrent conditions and concomitant medication use were not provided. During 2008, the patient was vaccinated with ZOSTAVAX, (lot# and route unknown) as recommended for routine adult health maintenance and for the prevention of shingles. The vaccine did not prevent shingles as intended, but rather caused the patient to contract a persistent strain of herpes zoster. During 2016, the patient was treated by a physician for a blistering vesicular outbreak and decreased immune symptoms which was then diagnosed as severe herpes zoster, or shingles. As a direct and proximate result of these malfunctions, the patient suffered painful injuries and damages, and required extensive medical care and treatment. As a further proximate result, the patient has suffered and will continue to suffer significant medical expenses, and pain and suffering, and other damages. Additional information has been requested.

CDC Split Type: US0095075131803USA004749
Write-up: This initial spontaneous report was received from a lawyer regarding a case in litigation and refers to a male patient of unknown age. Medical history, concurrent conditions, and concomitant medications were not provided. During 2016, the patient was inoculated (by an unspecified healthcare professional person) with ZOSTAVAX at a health care center as recommended for routine adult health maintenance for the prevention of shingles (dose, route of administration, site of administration and lot # were not provided). The vaccine did not prevent shingles as intended, but rather caused the patient to contract a persistent strain of herpes zoster. During 2016, the patient was treated (by an unspecified healthcare professional) at a physicians" practice for a persistent and severe vesicular rash accompanied by weakened immune symptoms which was diagnosed as herpes zoster, or shingles. As a direct and proximate result of these malfunctions, the patient suffered painful injuries and damages, and required extensive medical care and treatment. As a further proximate result, the patient has suffered and will continue to suffer significant medical expenses, and pain and suffering, and other damages. The outcome of the events was unknown. The lawyer felt the events were related to ZOSTAVAX. Additional information has been requested.

Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: The patient started to experience a low grade fever, joint pain, and nausea starting the morning after receiving the vaccination. The low grade fever was around 99 degrees and ended the evening of the 26th. The joint pain and nausea is still continuing as of the 27th. She also stated that her arm is red and swollen around the injection site. In addition to these she experienced feeling disconnected in a manner similar to a light switch flicking on and off. She said she feels something similar when withdrawing from her venlafaxine (she stated that she is still taking the venlafaxine daily, so it is not from actual withdrawal). She went to the doctors on the morning of the 27th and was told to take some BENADRYL for the allergic reaction on her arm and to take TYLENOL or Ibuprofen for the joint pain whichever she preferred.

Other Medications:
Current Illness: Asthma; Blood pressure high; Cholesterol levels raised; Congenital spinal stenosis; Seasonal allergy
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type: US0095075131804USA010028
Write-up: This spontaneous report was received from a 66 year old male physician referring to himself. With concurrent conditions of asthma, hypertension, increased blood cholesterol, congenital spinal stenosis and seasonal allergy, additionally the patient was vaccinated with PREVENAR 13, 14 months ago. No other medical history, concurrent conditions, drug reactions/allergies and concomitant medications were not provided. On 19-APR-2018, the patient was vaccinated with PNEUMOVAX 23 lot # N003993, expiration date 20-OCT-2018, (strength was not reported) in the left arm for prophylaxis. On the same date, within a few hours after the vaccine, the patient reported he began to experience pain, warmth, swelling and redness in the left arm within a few hours after receiving the PNEUMOVAX 23, and 5 to 6 hours after receiving the vaccination the symptoms extended to his left bicep. On 20-APR-2018, the patient experienced fatigue. The reporter stated that the pain, redness, swelling at the injection site "progressed from the antecubital fossa to the anterior, medial aspect" of his left elbow on 21-APR-2018. On the same date, the physician reported the pain from his left shoulder to the left clavicle. The pain from his left clavicle extended to the mediastinum that increased in severity when he was lying down. The physician reported he began to experience chills and esophageal discomfort that made it difficult to eat and drink. On 21-APR-2018, the patient took 80 mg of prednisone (unknown

manufacturer) and on 22-APR-2018, he took 60 mg of prednisone (unknown manufacturer). No lab tests were performed to the patient. The outcome of generalized pain, oesophageal discomfort, fatigue, injection site warmth, swelling and erythema was reported as recovering, "reported as symptoms improved by 50%". The outcome of chills was reported as recovered. The reporter considered the events to be serious due to disability. The causality between the events and the therapy was not reported.

Other Medications: 1 sleep aid night of vaccine, regular vitamins
Current Illness:
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: On the day after the vaccine I developed muscle aches, mostly in arms and hands as well as extreme fatigue. The muscle aches went away after two days and the fatigue lasted 4 days. I was told by the very goo pharmacist about the possible side effects. Having such fatigue is most likely an exception. I will make plans to be home and resting for the 4 days after my 2nd round of the Recombinant Zoster vaccine.

CDC Split Type: US0095075131805USA005995
Write-up: Information has been received on 14-MAY-2018 regarding a case in litigation from a lawyer and a female consumer of unknown age. The patient''s concurrent conditions, medical history and concomitant medications are unknown. During 2013, the patient was inoculated with ZOSTAVAX (lot number and expiration unknown) unknown route at a free clinic as recommended for routine adult health maintenance and for the prevention of shingles. The vaccine did not prevent shingles as intended, and the patient subsequently contracted a persistent strain condition of herpes zoster. During June 2016, the patient was treated for a blistering vesicular outbreak, which was diagnosed as herpes zoster, or shingles. As a direct and proximate result of the ZOSTAVAX and/or despite receiving the ZOSTAVAX for long-term prevention of shingles, the patient suffered painful injuries and damages, and required extensive medical care and treatment. As a further proximate result, the patient has suffered and will continue to suffer significant medical expenses and pain and suffering and other damages. Additional information has been requested.

Previous Vaccinations: He had a similar dizzy spell without fainting or throwing up after a vaccine about 1 year prior.
Other Medications: multi-vitamins
Current Illness: Cold or virus with a fever exactly one month prior.
Preexisting Conditions:
Allergies: OMNICEF
Diagnostic Lab Data:
CDC Split Type:
Write-up: Fainted approx. 2-5 minutes after the injection. Patient was sitting on a chair and the nurse caught him before he fell off. Patient came to quickly and was then nauseous and vomited stomach bile a few times. Patient exhibited cold sweats, dizziness, shakiness, and was faint and pale for approx. 15 minutes. Nurses gave him juice and observed until he could speak and stand up for five minutes. Mother took patient home, where he drank water and ate some toast and crackers. He still felt nauseous and unwell, and fell asleep about two hours after the injection.

Previous Vaccinations:
Other Medications: unknown
Current Illness: Denied acute illness on the screening checklist on the day of vaccine administration.
Preexisting Conditions: Denied long-term health problems on the screening checklist on the day of vaccine administration.
Allergies: Penicillin
Diagnostic Lab Data: None that I know of though clinician did take vital signs at the occupational health clinic.
CDC Split Type:
Write-up: Client came to our local office of health to receive the second dose in her Varicella series. Series was started years ago but never finished. Came in to clinic, filled out the screening form. No contraindications noted. Vaccine was prepared upon client arrival to clinic using aseptic technique, dose of 0.5ml administered in subcutaneous tissue the left arm. No complications during administration. Client tolerated well. She stayed in the office for 15 minutes of observation per protocol and was without complaint at time of leaving office. She called the office the next day 6/8/18 to report that she had experienced a local reaction and possibly a systemic reaction to the vaccine. She reported local redness/swelling at injection site "egg size" per client. She also reported that at 2-3pm the same day of the vaccine she had experience fatigue followed by nausea, vomiting and diarrhea. On the same day as receiving the varicella vaccine at our clinic she had also received a Tdap from an occupational health clinic, she went back to the occupational health clinic the next day 6/8/19 and at that time she reported to the practitioner the reactions from the previous day (fatigue, N/V/D). She reports during the assessment 6/8/19 she was still found to have a mild temperature (99f) and slightly low blood pressure (96 systolic). Client reports that the clinician told her to notify our clinic regarding the systemic reaction so that a report could be filed and that the occupational health clinic would also file a report as she had received a Tdap from them the same day at 9am.

Diagnostic Lab Data:
CDC Split Type: US0095075131806USA007067
Write-up: This initial spontaneous report was received from a lawyer regarding a case in litigation and refers to a male patient of unknown age. No information was provided regarding concomitant medications, concurrent conditions or medical history. On or about 03-JUN-2014, the patient was inoculated with the ZOSTAVAX vaccine at a drug store as recommended for routine adult health maintenance for the prevention of shingles (dose, route, and lot # not provided). The vaccine did not prevent shingles as intended and the patient subsequently contracted a persistent strain of herpes zoster. On or about 03-FEB-2015, he was treated by a physician for a blistering vesicular outbreak, which was diagnosed as herpes zoster. As a direct and proximate result of ZOSTAVAX

vaccine, and/or despite receiving ZOSTAVAX for long-term prevention of shingles, the patient suffered painful injuries and damages, and required extensive medical care and treatment. As a further proximate result, the patient has suffered and will continue to suffer significant medical expenses, and pain and suffering, and other damages. The outcome of the events was unknown. Causality assessment was related. Additional information has been requested.

Write-up: This case was reported by a pharmacist via call center representative and described the occurrence of herpes on lip in a 70-year-old female patient who received SHINGRIX (batch number TP5E5, expiry date 15th November 2020) for prophylaxis. On 20th June 2018, the patient received the 1st dose of SHINGRIX (intramuscular) .5 ml. In June 2018, less than a week after receiving SHINGRIX, the patient experienced herpes on lip. The patient was treated with VALTREX. On an unknown date, the outcome of the herpes on lip was not recovered/not resolved. It was unknown if the reporter considered the herpes on lip to be related to SHINGRIX. Additional details were provided as follows: This case was previously reported to the doctor. The patient

received her dose of SHINGRIX in the left deltoid. The patient was experiencing an outbreak of herpes simplex on her lips and her physician had prescribed VALTREX for her. The reporting pharmacist was not sure when the patient started having symptoms of the outbreak or when the outbreak began.

CDC Split Type: US0095075131807USA001014
Write-up: Information has been received on 02-JUL-2018 regarding a case in litigation from a lawyer and a male consumer of unknown age. The patient"s concurrent conditions, medical history and concomitant medications are unknown. In 2015, the patient was inoculated with ZOSTAVAX (lot number and expiration unknown) unknown route at a pharmacy, as recommended for routine adult health maintenance and for the prevention of shingles. The vaccine did not prevent shingles as intended, and the patient subsequently contracted a persistent strain condition of herpes zoster. On or about 19-JAN-2016, the patient was treated by a physician at a medical center for a vesicular outbreak, which was then diagnosed as herpes zoster conjunctivitis. The patient was prescribed VALTREX for management of his painful symptoms and chronic pain. As a direct and proximate result of the ZOSTAVAX and/or despite receiving the ZOSTAVAX for long-term prevention of shingles, the patient suffered painful injuries and damages, and required extensive medical care and treatment. As a further proximate result, the patient has suffered and will continue to suffer significant medical expenses and pain and suffering and other damages. Upon internal review, herpes zoster conjunctivitis was considered to be medically significant. Additional information has been requested.

Allergies:
Diagnostic Lab Data:
CDC Split Type: USGLAXOSMITHKLINEUS201814
Write-up: This case was reported by a nurse via call center representative and described the occurrence of neuropathy peripheral in a 60-year-old male patient who received SHINGRIX (batch number HG4P3, expiry date 13th July 2020) for prophylaxis. The patient''s past medical history included neuropathy (idiopathic Neuropathy). On 5th June 2018, the patient received the 1st dose of SHINGRIX (intramuscular). On 6th June 2018, 1 days after receiving SHINGRIX, the patient experienced neuropathy peripheral (serious criteria GSK medically significant). On an unknown date, the outcome of the neuropathy peripheral was unknown. It was unknown if the reporter considered the neuropathy peripheral to be related to SHINGRIX. Additional details were provided as follows: The patient had not an occurrence of idiopathic Neuropathy for many years. The patient received SHINGRIX and the next day the patient presented with symptoms.

Diagnostic Lab Data:
CDC Split Type: US0095075131809USA004895
Write-up: This initial spontaneous report was received from a lawyer regarding a case in litigation and refers to a male patient of unknown age. No information was provided regarding concomitant medications, concurrent conditions or medical history. On or about 30-AUG-2013, the patient was inoculated with ZOSTAVAX at a physician''s office as recommended for routine adult health maintenance for the prevention of shingles (dose, route, and lot # not provided). The vaccine did not prevent shingles as intended and the patient subsequently contracted a persistent strain condition of herpes zoster. In 2014, the patient was treated at the same physician''s office office

for a blistering vesicular outbreak which was diagnosed as herpes zoster or shingles. As a direct and proximate result of the ZOSTAVAX vaccine, and/or despite receiving ZOSTAVAX for long-term prevention of shingles, the patient suffered painful injuries and damages, and required extensive medical care and treatment. As a further proximate result, the patient has suffered and will continue to suffer significant medical expenses, and pain and suffering, and other damages. The outcome of the events was unknown. Causality assessment was related. Additional information has been requested.

CDC Split Type:
Write-up: Child in for routine PCV13 vaccine. Placed in side saddle position on mother''s lap, technique indicated/described by CDC. Mom was instructed on how to hold child during this technique. During the injection of the vaccine into the left thigh child moved leg enough that the needle came out of the left before the entire vaccine could be injected, only about 1/2 given. Following the incident a small second puncture site noted just next to the vaccine injection site which must have happened during incident. Area wiped clean and Band-Aid applied. Mom instructed that this dose could not be counted as valid as it was not the complete amount. Mother was very understanding and did schedule another appointment in 1 month to get the dose repeated. She was instructed on aftercare and the child was kept for the 15 minute post immunization observation period. Notification sent to local nurse supervisor, immunization nurse program coordinator and the immunization program chief.

Preexisting Conditions: same above
Allergies: NKA
Diagnostic Lab Data: none the patient had not reported any adverse reaction at this time.
CDC Split Type:
Write-up: The patient was given the SHINGRIX with the diluent of sterile Diluent instead of the Adjuvant suspention component to form the SHINGRIX given on 9/17/2018 in Right Deltoid. This was the patients #2 vaccine. This was discovered on 09/24/2018 when their was an extra Adjuvant suspention component left in the box. The was a message left for the patient to call back to the clinic. For us to notify the patient what had happen. He had not reported any adverse reaction at this time. On 9/24/2018 I had contacted the immunization program to verify what had happen and how soon the patient could get the corrected dose.

Diagnostic Lab Data:
CDC Split Type: USGLAXOSMITHKLINEUS201817
Write-up: This case was reported by a pharmacist via call center representative and described the occurrence of kidney transplant rejection in a adult patient who received SHINGRIX for prophylaxis. On an unknown date, the patient received SHINGRIX at an unknown dose. On an unknown date, less than a year after receiving SHINGRIX, the patient experienced kidney transplant rejection (serious criteria GSK medically significant). On an unknown date, the outcome of the kidney transplant rejection was unknown. It was unknown if the reporter considered the kidney transplant rejection to be related to SHINGRIX. Additional information received as follows: The age at vaccination was not reported. The age group was not reported but was selected adult

as per vaccine indication. The healthcare professional was a retail pharmacist. The healthcare professional stated receiving a call regarding the administration of SHINGRIX to the patient who had an organ transplant. The healthcare professional stated that a staff member at a physician''s office stated that the patient there recently lost their kidney transplant due to receiving a shingles vaccine but that the patient also had multiple other issues that likely led to the loss of the kidney transplant. The healthcare professional did not have access to this patient, did not know this patient. Retail pharmacy did not administer this vaccine. The healthcare professional did not have any additional information to document for this adverse event. No vaccine or patient information available, only information was received by the healthcare professional in passing conversation over the phone while discussing the different patient.

CDC Split Type:
Write-up: On 10/2/18 at approximately 1:30 PM, I administered a flu vaccine per protocol to patient at employee/spouse clinic. Since it was her first flu vaccine, I asked her to stay for a 15

minute observation in the event of any untoward reaction to the vaccine. After 10 minutes elapsed, patient complained of dizziness, lightheadedness and visual disturbances. She was fully oriented, heart rate was palpable and approximately 70, she answered questions appropriately and was not experiencing difficulty breathing. Her eyes closed and she had difficulty sitting up and supporting her head. 911 was called for assistance. I moved her to a supine position which helped somewhat, but she still complained of the above symptoms although they were less severe. In addition, she started complaining of lower abdominal discomfort. Vital signs before EMTs arrived were 86/54, 78 and 20. After EMTs arrived, her vital signs continued to be on the low side. Blood glucose was 129. The decision was made to transport her to the ER for further evaluation. Her husband had been called and arrived to accompany her in the ambulance which departed at approximately 2PM.

Diagnostic Lab Data: n/a
CDC Split Type:
Write-up: Muscle pain began late in the afternoon on 7/24, along with a headache. The headache got progressively worse to the point that it awakened her in the evening and she took 2 TYLENOL. The morning of 7/25/18, she had to get up for 2 appointments. She stated her head throbbed continually and she felt out of herself. She made it to the first appointment but doesn''t recall what was said to her. She immediately returned home and went to bed for the rest of the day. She was exhausted. The headache subsided after lunch 7/25 and then she noticed her arm (at injection site) was swollen, red and hot. She stated the swelling went down to her elbow. She iced it and again took TYLENOL and went back to bed. By 7/26/18 most of her symptoms had subsided. She doesn''t want to receive the 2nd dose.

CDC Split Type:
Write-up: Instant black and blue bruise and swelling at injection site that increased in size over 10 min. Pain and soreness radiating up arm throughout shoulder and neck within minutes as well as pain radiating down left leg, described as "muscle soreness and aches". I asked patient to wait in the store for about 40 min following vaccine, checking up every 10 min. Called her primary care physician that she was supposed to see that day for a flu shot but decided to come to pharmacy instead. Spoke w nurse/MD who advised me that patient was ok to go home and should just be aware if symptoms don"t subside. Counseled patient that she should see her MD if the pain/aches did not get better or got worse throughout the night. Checked up on patient at home 1.5 hours after vaccine and she seemed to be feeling okay, leg was still achy but arm and neck getting better. Advised her to ice arm to decrease swelling.

Write-up: Information has been received from a lawyer regarding a case in litigation concerning a female patient of unknown age. The patient''s medical history, concurrent conditions and concomitant medications were not provided. On an unknown date in 2012, the patient was vaccinated with a dose of ZOSTAVAX, (dose, route of administration, anatomical location, lot # and expiration date were not reported) for routine adult health maintenance and for the prevention of shingles. The vaccine did not prevent shingles as intended, and the patient subsequently contracted a persistent strain of herpes zoster (onset date was not provided). On an unknown date in 2016, the patient was treated by a physician for a vesicular rash, which was diagnosed as herpes zoster or shingles. As a direct and proximate result of ZOSTAVAX vaccine, and/or despite receiving ZOSTAVAX for long-term prevention of shingles, the patient suffered painful injuries and damages, and required extensive medical care and treatment. As a further proximate result, the patient has suffered significant medical expenses, and pain and suffering, and other damages. The outcome of the events was unknown. The reporter determined the events to be related to the ZOSTAVAX.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Pt reports receiving first dose of SHINGRIX at pharmacy and approximately 10 minutes later she began to have tingling and pain to skin from mid-back wrapping around to front of abdomen in a line. She was seen in PCP office and noted to have raised, red, blistered areas along where she complained of pain. Covering MD and infectious disease MD both examined patient and concur that affected areas are zoster. Pt is being treated with antiviral medication.

Diagnostic Lab Data:
CDC Split Type: USGLAXOSMITHKLINEUS201819
Write-up: This case was reported by a other health professional via call center representative and

described the occurrence of cancer in a female patient who received SHINGRIX for prophylaxis. On an unknown date, the patient received the 1st dose of SHINGRIX. In September 2018, unknown after receiving SHINGRIX, the patient experienced cancer (serious criteria GSK medically significant). On an unknown date, the outcome of the cancer was unknown. It was unknown if the reporter considered the cancer to be related to SHINGRIX. Additional details were provided as follows: The age at vaccination was not applicable. The reporter stated via online chat that the patient was diagnosed with cancer in September 2018. The patient had already received one dose of SHINGRIX, but the timing was unknown. No other information was provided. The chatter stated that question was urgent and that the patient was waiting at the time of reporting. The reporter stated that the timing was unknown, but if the patient was diagnosed in September it was likely that the patient received the first dose before being diagnosed.

Diagnostic Lab Data: none
CDC Split Type:
Write-up: Severe shaking/shivering total body symmetrical, headache frontal bilateral. I did not feel hot to touch. There was no sweating, no nausea, no dizziness, no myalgia, no pain except in upper arm at and near site of injection, no vomiting, no difficulty breathing, no hives, no rash. I didn''t feel cold but tried to fix my shaking by heating the house holding on to heat pads and adding bed covers. I was too shay to drink anything or take a temperature as my arms were wildly moving and my legs were so unsteadies to prevent walking to get to phone or kitchen. After it was over there were no other effects. Shivering/severe shaking lasted for 6 hours from 7 pm Oct 24 until 2 am Oct 25 I discussed this reaction with my physician Dr on Oct 30 at an annual visit because I was planning to get a Flu vaccine. I am holding back on flu vaccine this year in case I have developed some sensitivity to vaccines.

Write-up: Information has been received from a lawyer regarding a case in litigation concerning a patient of unknown age and gender. No information was received regarding the patient''s past medical history, concurrent conditions, or concomitant medication. The patient''s healthcare provider (unspecified healthcare professional), recommended and/or prescribed ZOSTAVAX to the patient for its intended purpose of permanent prevention and protection against shingles and zoster-related conditions. On or about 2011, a pharmacist at a pharmacy administered the ZOSTAVAX (lot number, dosage and route of administration not provided) to the patient. On or about 03-DEC-2016, the patient was treated by a registered nurse/RN at a health care facility for shingles. The patient was diagnosed with shingles and/or other zoster-related injuries after and despite being inoculated with the ZOSTAVAX vaccine, and suffered serious physical, emotional, and economic damages as a result of the patient''s injuries. As a direct and proximate result of the ZOSTAVAX vaccine, the patient has and will continue to suffer ongoing injuries, including but not limited to: mental and physical pain and suffering; extensive medical care and treatment for these injuries; significant medical and related expenses as a result of these injuries, including but not limited to medical losses and costs include care for hospitalization, physician care, monitoring, treatment, medications, and supplies; diminished capacity for the enjoyment of life; a diminished quality of life; increased risk of premature death; aggravation of preexisting conditions and activation of latent conditions (unspecified); lost wages; loss of earnings capacity; and other losses and damages. The outcome of the events was considered to be not recovered. Additional information has been requested.

CDC Split Type: US0095075131811USA006819
Write-up: Information was received from a lawyer regarding a case in litigation and refers to a female patient of unknown age. Medical history, concurrent conditions, and concomitant medications were not provided. The patient''s healthcare provider (unspecified healthcare professional), recommended and/or prescribed ZOSTAVAX to the patient for its intended purpose of permanent prevention and protection against shingles and zoster-related conditions. In 2015, a healthcare provider (unspecified healthcare professional), at a pharmacy, administered the ZOSTAVAX (lot number, dosage and route of administration not provided) to the patient. In 2016, the patient was treated by an unspecified healthcare professional at a medical center for shingles. The patient was diagnosed with shingles and/or other zoster-related injuries after and despite being inoculated with the ZOSTAVAX vaccine, and suffered serious physical, emotional, and economic damages as a result of the patient''s injuries. As a direct and proximate result of the ZOSTAVAX vaccine, the patient has and will continue to suffer ongoing injuries, including but not limited to: mental and physical pain and suffering; extensive medical care and treatment for these injuries; significant medical and related expenses as a result of these injuries, including but not limited to medical losses and costs include care for hospitalization, physician care, monitoring, treatment, medications, and supplies; diminished capacity for the enjoyment of life; a diminished quality of life; increased risk of premature death; aggravation of preexisting conditions and activation of latent conditions (unspecified); lost wages; loss of earnings capacity; and other losses and damages. The outcome of the events was considered to be not recovered. Additional information has been requested.

Diagnostic Lab Data:
CDC Split Type: USSA2018SA328851
Write-up: Initial information received on 28-Nov-2018 regarding an unsolicited valid non-serious case received from a nurse. This case involves a 70 years old male patient who was vaccinated with a 0.5 ml dose of FLUZONE HIGH DOSE (Batch number: UJ043AB, expiration date: 22-May-2019, route: intramuscular and site of administration was right deltoid) on 26-Nov-2018. The patients medical history and concomitant medications were not reported. It was an actual medication error due to incorrect product storage. Nurse states that she accidentally gave a FLUZONE HIGH DOSE injection to a patient after a temperature excursion/no AE. No adverse event reported. This suspected adverse reaction report is submitted and classified as a medication error solely and exclusively to ensure the marketing authorization holders compliance with the requirements set out in Directive 2001/83/EC and Module VI of the Good Pharmacovigilance Practices. The classification as a medical error is in no way intended, nor should it be interpreted or construed as an allegation or claim made by the marketing

authorization holder that any third party has contributed to or is to be held liable for the occurrence of this medication error. List of documents held by sender: none.

Current Illness: common cold, no fever
Preexisting Conditions: Asthma, Dysmenorrhea, ADHD, Depressive D/O
Allergies: Prednisone
Diagnostic Lab Data: N/A
CDC Split Type:
Write-up: Red area developed around injection site in the right arm several hours after receiving the PCV23 vaccine and became the size of a half dollar per patient''s mother. Hives also developed in upper right arm after several hours and gradually spread to the lower arm. Right arm described as very sore. Patient denied fever, denied shortness of breath, and denied throat swelling/closing. The vaccines were given on 12/14/2018 and adverse reaction was reported to us by the patient''s mother on 12/17/2018. Patient''s PCP, NP was informed immediately. NP recommended cold compresses, ibuprofen as needed for discomfort, and to follow-up with an office visit if redness persists/worsens or if pt. develops a fever. Explained that the symptoms would improve slowly. NP also informed staff to do VAERS report.

Current Illness: None
Preexisting Conditions: None
Allergies: None
Diagnostic Lab Data: They did an xray and some bloodwork nothing else yet
CDC Split Type:
Write-up: When Vacine was administered, I remember thinking it was given too high in the arm, and the administrator stated it was VERY hard to push in. About 17 hours after receiving shot I awoke to significant pain in the left shoulder, where I received the shot. Over the next day or so the pain continued but also seemed to worsen whenever I tried to use that arm-as in reaching across, over my head or behind me. After about a week and a half I went to the doctors- he told me just to watch it and take Aleve instead of ibuprofen. After another several days I called back as pain is not lessening-he recommended I go to muscle- skeletal doctor-as well as have x-ray and blood work done (both showed nothing). I was seen at ortho about 3 weeks to a month after administration of shot. That doctor said it was a probable rotator-cuff injury and to even double or triple my aleve intake as well as start PT. (First appointment with PT tomorrow 12/27/18.) In the mean time I followed up with my PCP. (The first doctor I saw was at my PCP''s office but not her.) My regular PCP- prescribed an oral steroid as my pain had not improved or lessened taking aleve or Ibuprofen. My understanding is PT and steroids and if the pain continues then we will do an MRI of the soft tissue. I have been unable to effectively use my left arm related to pain for over one month currently.

Write-up: Information has been received from a lawyer regarding a case in litigation concerning a female patient of unknown age. No information was received regarding the patient''s past medical history, concurrent conditions, or concomitant medication. The patient''s healthcare provider recommended and/or prescribed the ZOSTAVAX to the patient for its intended purpose of permanent prevention and protection against shingles and zoster-related conditions. On an unknown date in 2008, a healthcare provider at a department of health administered the ZOSTAVAX to the patient (lot number, dosage and route of administration not provided). On an unknown date in 2017, the patient was treated by a healthcare provider at a hospital for shingles. The patient was diagnosed with shingles and/or other zoster-related injuries after and despite being inoculated with the ZOSTAVAX vaccine, and suffered serious physical, emotional, and economic damages as a result of her injuries. As a direct and proximate result of the ZOSTAVAX vaccine, the patient has and will continue to suffer ongoing injuries, including but not limited to: mental and physical pain and suffering; extensive medical care and treatment for these injuries; significant medical and related expenses as a result of these injuries, including but not limited to medical losses and costs including care for hospitalization (dates unknown), physician care, monitoring, treatment, medications, and supplies; diminished capacity for the enjoyment of life; a diminished quality of life; increased risk of premature death, aggravation of preexisting conditions and activation of latent conditions (unspecified); lost wages; loss of earnings capacity; and other losses and damages. The outcome of the events was considered to be not recovered. Additional information has been requested.

Write-up: This initial spontaneous report was received from a lawyer regarding a case in litigation and refers to a male patient of unknown age. No information was provided regarding concurrent conditions, medical history, or concomitant medications. On or about 03-FEB-2014, a healthcare provider at a family practice administered ZOSTAVAX to the patient to obtain permanent prevention and protection against shingles and zoster-related injuries/conditions (dose, route, and lot # not provided). In 2017, the patient was treated by a healthcare provider at an express care facility for shingles. The patient was diagnosed with shingles and/or other zoster-related injuries after and despite being inoculated with ZOSTAVAX, and suffered serious physical, emotional, and economic damages as a result of the patient''s injuries. As a direct and proximate result of ZOSTAVAX, the patient has and will continue to suffer ongoing injuries, including but not limited to: mental and physical pain and suffering; extensive medical care and treatment for these injuries; significant medical and related expenses as a result of these injuries, including but not limited to medical losses and costs including care for hospitalization, physician care, monitoring, treatment, medications and supplies; diminished capacity for the enjoyment of life; a diminished quality of life; increased risk of premature death, aggravation of preexisting conditions and activation of latent conditions; lost wages; loss of earnings capacity; and other losses and damages. The outcome of the events was not recovered. Causality assessment was related. Additional information has been requested.

Write-up: This case was reported by a pharmacist via call center representative and described the occurrence of extensive swelling of vaccinated limb in a 76-year-old female patient who received SHINGRIX (batch number H547E, expiry date 22nd February 2021) for prophylaxis. On 9th November 2018, the patient received the 1st dose of SHINGRIX. On 10th November 2018, 1 days after receiving SHINGRIX, the patient experienced extensive swelling of vaccinated limb and injection site erythema. On an unknown date, the outcome of the extensive swelling of vaccinated limb and injection site erythema were recovered/resolved. It was unknown if the reporter considered the extensive swelling of vaccinated limb and injection site erythema to be related to SHINGRIX. Additional details were provided as follows: The patient experienced an area of swelling and redness from the injection site to the elbow. These symptoms persisted for 2 and half to 3 weeks and resolved. The reporter consented to follow up.

Previous Vaccinations:
Other Medications: unknown
Current Illness: none reported
Preexisting Conditions: None reported during screening
Allergies: Allergy to OMNICEF (antibiotic)
Diagnostic Lab Data: PCP ordered CBC, unsure if was performed. Unknown if there was follow-up with PCP. Attempted to call mother 2/11/19 to check in but no answer, message was left.
CDC Split Type:
Write-up: Child was quite behind on vaccinations after missing several appointments with our office. Came in with mom, VIS statements given and screening checklist completed. Mom denied any illness, client was noted to have rosy cheeks, appearance similar to rosacea, he has fair skin and mom reports as sensitive skin. Child received vaccinations, he did cry pretty hard during the process as one would expect. He was consoled quickly after the injections were complete. Several minutes after the injections checked on client, he was drinking a bottle and interacting appropriately, normal behavior. At that time it was noted he had small petechiae on his face.

Noted on forehead, eye lids and cheeks. None noted anywhere else on his body. We questioned if this was related to the crying during the procedure. We watched the child for the full 15 minutes and maybe a bit longer, no change in rash, no signs of other reaction. Mom was instructed to keep an eye on him and to bring to ED if any changes. Once the child had left we discussed case with each other and decided it would be best to let the Immunization program chief and the child''s PCP know about the event in case it was a reaction to one of the vaccines. Mother was made aware we would be contacting the PCP, at the time of this call she reports child is behaving normally and no change or worsening of rash. PCP called and he did decide to order bloodwork, CBC. When called mother to let her know about the order she was resistant to bring the child in for bloodwork that night. She was encouraged by this nurse to call the PCP to discuss risk versus benefits of that decision. PCP also called by this nurse and made aware of mother''s response, at that point transfer of care to PCP.

Write-up: This case was reported by a consumer via call center representative and described the occurrence of adverse reaction in a female patient who received SHINGRIX for prophylaxis. On an unknown date, the patient received the 1st dose of SHINGRIX. On an unknown date, unknown after receiving SHINGRIX, the patient experienced adverse reaction and infection. The patient was treated with antibiotics nos. On an unknown date, the outcome of the adverse reaction and infection were recovered/resolved. It was unknown if the reporter considered the adverse reaction and infection to be related to SHINGRIX. Additional details were provided as follows: The age at vaccination was not reported. In 2018, the patient got 1st dose of SHINGRIX 3 months before the reporting time. The patient had a reaction that her doctor thought was an infection. The patient took antibiotics and got better. Caller disconnected before the patient could clarify what the reactions were she experienced. This case was 2 of the 2 cases, reported by the same reporter.

CDC Split Type:
Write-up: Child came in for DTaP, he received dose in left deltoid, tolerated well. No adverse reaction noted during 15 minute observation period. Mother of child called the next day to report that he had vomited at 2am, then again at 3am and again at 8am. No fever noted in AM, but at time of the call, 2:30pm, temp of 99. Mom notes poor appetite, malaise. Mom states injection site and arm are unremarkable. This nurse did suggest she also notify the child"s PCP. Called mother back on Monday to check in and she reports Saturday energy was better but still low appetite but seemingly starting to feel better, then Sunday vomited again and had diarrhea. Explained to mom that it is very possible this illness is unrelated but that I would put in a VAERS just to be cautious.

CDC Split Type: USGLAXOSMITHKLINEUS201908
Write-up: shingles-like rash on right side of body/rash; This case was reported by a pharmacist via call center representative and described the occurrence of vesicular rash in a 61-year-old male patient who received Herpes zoster (Shingrix) (batch number 4ZF42, expiry date 18th April 2021) for prophylaxis. On 22nd March 2019, the patient received the 1st dose of Shingrix. On 24th March 2019, 2 days after receiving Shingrix, the patient experienced vesicular rash. On an unknown date, the outcome of the vesicular rash was recovered/resolved. It was unknown if the reporter considered the vesicular rash to be related to Shingrix. Additional details were reported as follows: The patient developed a shingles like rash on the right side of his body that resolved after 2 weeks. The patient did not seek medical treatment for the rash.

Write-up: HPV vaccine #2 was given upper R deltoid 4 days ago. Arm was hurting that evening, seemed to be hurting more than usual with a vaccine. Developed swelling and pain in right armpit next day. Day before yesterday mom looked at it and it looked terrible, swollen and red all in her armpit. Family was away for a soccer tournament, decided to wait. Has gotten a little better, still a little swollen, still hurting. Otherwise feeling fine. Normal energy, normal appetite. Played soccer this weekend. No fever. No vomiting or diarrhea. Sleeping fine at night.

CDC Split Type:
Write-up: My daughter was vaccinated in the late afternoon. She was very sleepy afterward and had no appetite. I put her to bed around 7:00 PM and watched her on the baby monitor. At approximately 11:00 PM I tried to offer her milk, as she was exclusively breastfed, but she would not wake up to eat. I decided to change her diaper, thinking that might help to rouse her. But she did not wake up. This was highly unusual for her, as she was always a very light sleeper. I called the nurse''s line at my pediatrician''s office and she advised me to turn on the lights, undress her, rub her skin, and make some noise as to make her uncomfortable. It took 10-15 minutes to get her to wake up and give an appropriate response by crying.

CDC Split Type: US0095075131907USA001340
Write-up: Pain in arm for 6 weeks; Heaviness; Discomfort with movement; Muscle soreness; This spontaneous report as received from a pharmacist and a nurse refers to a currently 40 year old female patient. The patient''s medical history, concurrent conditions, drug reactions/allergies and concomitant medications were unknown. On an unknown date, the patient was vaccinated with the first dose of hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9) (Strength, dose, route of administration, anatomical location, lot number and expiry date were unknown) for prophylaxis. On an unknown date, the patient experienced pain in the arm for 6 weeks post administration with hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9). On unknown dates, the patient also experienced heaviness, discomfort with movement and muscle soreness after getting vaccinated with the first dose of hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9). On an unknown date, the patient was vaccinated with the second dose of hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9). However, no adverse experiences were reported with the second dose of hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9). No product quality complaint (PQC) was associated with the report. The outcome of the event of pain in extremity was considered to be recovering (Also reported as "starting to go away now "). The outcome of the events of discomfort, movement disorder and myalgia was considered to be unknown. The reporter did not provide the causality assessment for the reported events with hpv rl1 6 11 16 18 31 33 45 52 58 vlp vaccine (yeast) (GARDASIL 9).

Write-up: herpez zoster; This initial spontaneous report was received from a lawyer regarding a case in litigation and refers to a currently 77-year-old male patient. No information was provided regarding medical history, concurrent conditions, or concomitant medications. On or about 25-JAN-2013, the patient was vaccinated with zoster vaccine live (ZOSTAVAX) (lot#, expiration date, dose, dose# and route of administration not specified) for the long-term prevention of shingles and zoster-related conditions by a pharmacist. On an unspecified date, the patient experienced herpes zoster and was treated by a physician. The outcome of herpes zoster was unknown. The reporter considered herpes zoster to be related to Zoster Vaccine Live (ZOSTAVAX).

Write-up: Sore arm; This case was reported by a pharmacist via call center representative and

described the occurrence of pain in arm in a adult patient who received Herpes zoster (Shingrix) for prophylaxis. On an unknown date, the patient received the 1st dose of Shingrix. On an unknown date, less than 2 years after receiving Shingrix, the patient experienced pain in arm. On an unknown date, the outcome of the pain in arm was unknown. It was unknown if the reporter considered the pain in arm to be related to Shingrix. Additional information received were as follows: The age at the vaccination was not reported. The age group was not reported but it was selected as adult as per vaccine indication. The patient received Shingrix on an unknown arm. The pharmacist stated that the patient had a very sore arm and was inquiring if an alternate sight (thigh) could be used instead. The caller stated that the patient received the vaccine at another pharmacy and therefore did not had additional information regarding the event.

Write-up: Injection site reactions; Fatigue; feel like they need a nap; This case was reported by a pharmacist via call center representative and described the occurrence of injection site reaction in an unspecified number of adult patients who received Herpes zoster (Shingrix) for prophylaxis. On an unknown date, the patient received Shingrix at an unknown dose. On an unknown date, less than 2 years after receiving Shingrix, the patient experienced injection site reaction, fatigue and sleepiness. On an unknown date, the outcome of the injection site reaction, fatigue and sleepiness were unknown. It was unknown if the reporter considered the injection site reaction, fatigue and sleepiness to be related to Shingrix. Additional details were provided as follows: The age at vaccination was not applicable for this report. The reporter stated that the most commonly seen adverse events from Shingrix that they have noted at the pharmacy are local injection site reactions. The reporter stated that about 50% of patients also experience severe fatigue, they get very tired, feel like they need a nap and end up sleeping for 16 hours. The reporter consented to follow up. The reporter granted permission for follow up.

CDC Split Type:
Write-up: Child"s mother called 8/29/19 at 9:15 am to report child had experienced a reaction to one of the vaccines, she was looking to find out which vaccine was given in the left arm in the area below the shoulder and not at the back of the arm. *this was the DTaP*. Mother reports the day after the vaccines was given (Tuesday) she noted some redness at the injection site, he also had a mild fever that night 100.4 and did experience vomiting. She report Wednesday the redness had progressed to be from the shoulder to the elbow, and that the area of the injection looked bruised, and she now noted swelling from the shoulder to the elbow. Child reports pain in arm but also generalized pain, neck, back, legs, and stomach with associated vomiting and decreased appetite. Mom reports that she has not taken the child to see his provider yet. This nurse strongly encouraged she get the child in to see his provider as soon as possible, guided mom to be sure to report the severity of the symptoms to doctor when calling to schedule as he should be seen today. Read through the VIS with the mother, outlining the information in the "Risk of Vaccine Reaction" section which does indicate that this type of swelling can occur but it is more rare. Did discuss alternative rare reactions which could include abscess at the site of injection. Again, strongly encouraged she get the child in to be evaluated by his provider.

Write-up: Redness and swelling at site of injection and down toward the elbow began on

Thursday (8/22/19) she iced the area and took Benadryl, but the area remained swollen, red and became hot to the touch. On Sunday, 8/25/19, she went to express care and was told to take zyrtec along with the benadryl and continue to ice the area. She did this until Tuesday, 8/27/19, when she returned to express care and was given prednisone 20mg daily and was told to continue zyrtec and icing. Today, 8/29/19, the redness and swelling have come down. It is no longer hot to the touch, but her arm still feels strange.

Current Illness: None
Preexisting Conditions: High cholesterol, high blood pressure, GERD, insomnia
Allergies: Allergic to bergamot, iodine, feathers (as in down pillows, duvets, etc.). Also react to mold and mildew with coughing, sneezing, post-nasal drip, etc.
Diagnostic Lab Data: None.
CDC Split Type:
Write-up: Severe pain at the time of injection followed a day later by a red rash around the site of injection that lasted for a few days. The pain at the injection site has been continuous, is still present 5 months later and shows no signs of abating. I am currently receiving physical therapy to help restore range of motion to my left arm and shoulder. The center of the problem is in the deltoid muscle where I received the shot. My shoulder joint is moving more easily thanks to physical therapy, but even trying to move my arm to the side or behind me is nearly impossible and causes me to experience arm pain in the muscle where I got the shot.

Write-up: Very tired one day after injection. Next day (second day after vaccine) started having aches in joints mostly on left side of body?knee, ankle, wrist. Then muscles aches on left.. Tingling started in left foot and left hand, traveled up leg. Over the next few days knee and ankle on right

side had aches, and tingling spread to both feet, shins, hands, face including eyelids, inside eyes, inside mouth, side of face. Swelling developed behind left knee which primary care doctor thought could be popliteal cyst from possible arthritis in left knee irritated by immune response to vaccine. Now can?t bend left knee easily. as too painful. Now three and a half weeks out, most joint aches are gone except for left knee but tingling has continued, moving to different parts of body including face, especially eyelids, feet, hands, legs.

Write-up: No pain or abnormalities upon administration. Pharmacist covered with bandage. The next day the patient noticed a bruse underneath the bandage. It was a little achy and slightly warm. It didn''t bother her otherwise had no pain or sensation. Kept moving her arm. Has no pain/sensation like a normal bruise. Bowling didn''t irritate it. Just has a visual bruise and it feels a little bit warm. Patient has tried icing but it didn''t change the size. It is however turning yellow (healing) and starting to get slightly smaller. As long as it continues to get smaller, no further medical action is necessary. If patient develops a fever, or experiences pain/tenderness advised her to be checked out.

Write-up: expired dose of Fluzone was given to a 24 year old pregnant patient, no AE; expired dose of Fluzone was given to a 24 year old pregnant patient, no AE; Initial information received on 04-Oct-2019 regarding an unsolicited valid non-serious case received from a nurse. This case involves a 24 years old female patient who received expired dose of vaccine INFLUENZA QUADRIVAL A-B VACCINE [FLUZONE QUADRIVALENT] (lot number not reported, that expired in June) via unknown route in unknown administration site on an unknown date, while she was pregnant. Data regarding this pregnancy were received prospectively, i.e. before pregnancy outcome was known. The vaccination occurred at unknown gestation period. The date of last menstrual period was not reported. The estimated due date was not reported. The patient''s past medical history, medical treatment(s), vaccination(s) and family history were not provided. It was an actual medication error case due to expired vaccine used. It was also a case of vaccine exposure during pregnancy. At the time of report, no adverse event was reported. Additionally, at

time of reporting, the outcome of the pregnancy was unknown. This suspected adverse reaction report is submitted and classified as a medication error solely and exclusively to ensure the marketing authorization holder''s compliance with the requirements set out in Directive 2001/83/EC and Module VI of the Good Pharmacovigilance Practices. The classification as a medical error is in no way intended, nor should it be interpreted or construed as an allegation or claim made by the marketing authorization holder that any third party has contributed to or is to be held liable for the occurrence of this medication error. Information on the batch number was requested. List of documents held by sender: none.

CDC Split Type: USGLAXOSMITHKLINEBD2019GS
Write-up: Vaccination failure; Rotavirus diarrhea; This case was reported in a literature article and described the occurrence of vaccination failure in a 14-week-old patient who received Rota (Rotarix liquid formulation) for prophylaxis. Co-suspect products included Rota (Rotarix liquid formulation) for prophylaxis and Polio Bivalent T1 T3 oral (Oral polio vaccine) for prophylaxis. On an unknown date, the patient received the 1st dose of Rotarix liquid formulation (oral), the 2nd dose of Rotarix liquid formulation (oral) and Oral polio vaccine (oral). On an unknown date, 56 days after receiving Rotarix liquid formulation, 28 days after receiving Rotarix liquid formulation and not applicable after receiving Oral polio vaccine, the patient experienced vaccination failure (serious criteria GSK medically significant) and diarrhea rotavirus (serious criteria GSK medically significant). On an unknown date, the outcome of the vaccination failure and diarrhea rotavirus were unknown. The reporter considered the vaccination failure and diarrhea rotavirus to be related to Rotarix liquid formulation and Rotarix liquid formulation. The reporter considered the diarrhea rotavirus to be related to Oral polio vaccine. Additional details were reported as follows: This case was reported in a literature article and described the vaccination failure in a infant patient of 14-weeks-old of unspecified gender who was vaccinated rotarix vaccine (GlaxoSmithKline) for prophylaxis. The patient was the part of the phase IV double-blind, parallel group, randomized controlled trial from June 2017 through June 2018 at the community research clinic maintained by the International Centre, that aimed to compare vaccine take (primary outcome) among healthy infants randomized to receive either the standard dose or double the standard dose of oral Rotarix vaccine at 6 and 10 weeks of life. Also aimed to evaluate the effect of increased Rotarix inoculum on vaccine take among infants. They hypothesized that an increased vaccine inoculum would lead to improved vaccine take in this population. The study was registered at web site. [In this study, Healthy infants were enrolled within the first week of life. All the enrolled infants does not have any congenital malformations, birth (weight) or enrollment weight was more than the 2000 gm, does not had any immunocompromising condition infants. Infants were randomized using random permuted blocks. Randomization by unique study identification number (SID) was pre-determined 1:1 to the high-dose or standard-dose arm using random permuted blocks (block sizes 4 and 8). The 220 infants were enrolled and randomized (110 per group). By the 220, whom 189 completed the study per-protocol: 97 standard-dose and 92 high-dose infants completed the study per-protocol. The first infant was enrolled on 12th June 2017. Upon achieving targeting enrollment, the final infant was enrolled 25th February 2018 and completed the study on 7th June 2018]. The patient belongs to the high dose arm. No information on patient''s medical or family history or concurrent condition or concomitant condition was provided. On unspecified date between 12th June 2017 to 7th June 2018, at the age of 6 week, the patient received 1st dose of oral rotarix vaccine and at the age of 10 week, the patient received 2nd oral rotarix vaccine (dosage unknown; batch number not provided) and 1 week following the rotarix vaccination and at the age of 11 week, the patient had received oral unspecified polio vaccine (OPV) as per the Expanded Programme on Immunizations (EPI) schedule. [In this study, Rotarix (RV) was a monovalent oral vaccine consisting of an live-attenuated, G1P strain of human rotavirus. It was pre-qualified by

WHO in 2009 and was currently the most widely used RV vaccine in national immunization program. Rotarix was administered on a 2 doses schedule at 6 and 10 weeks of life on the WHO-recommended Expanded Programme on Immunizations (EPI) schedule. Infants in the high-dose arm received 2 doses of Rotarix, each consisting of 1.5 mL of clear liquid, at 6 and 10 weeks of life. Infants in the standard-dose arm received 1st dose of Rotarix (1.5 mL) and one equivalent volume of a sterile, pharmacy grade water at 6 and 10 weeks of life. The lot numbers of vaccines used in this study were AROLB475AI, AROLB580AB, AROLB834BF, AROLB855AA, AROLB832BH, AROLB910AE, AROLB884AF, and AROLB955BJ. To separate oral polio vaccine (OPV) from Rotarix administration, all children in the study received standard EPI vaccines (including OPV) one week following each Rotarix dose at the nearest EPI clinic. EPI vaccine history was recorded by the study team from each infant''s immunization card. Infants were included in the per-protocol population if both vaccine doses were administered within the pre-specified window period for vaccination (week 6 + 7 days for dose 1 and 28-35 days later for dose 2), at least 1 mL of blood was successfully collected at both week 6 and week 14, the first two stool specimens following each vaccine dose were collected within the pre-specified window periods (3-4 days and 6-7 days post-vaccination), and the first dose of OPV was received no earlier than the day of surveillance stool collection at 6-7 days post-1st-dose]. On unspecified date between 12th June 2017 to 7th June 2018, 4 weeks after the 2nd dose of Rotarix, 3 weeks after OPV, the patient had an symptoms of diarrheal episodes. The patient''s stool sample and plasma specimen has been taken for the RV-IgA measurement by enzyme immunoassay (EIA). The stool specimens were tested for RV by qRT-PCRa and positive specimens subsequently underwent conventional RT-PCR to amplify the RV VP8 gene segment followed by Sanger sequencing using VP4F and/or VP4R primers and BLAST analysis to confirm Rotarix vaccine-strain virus. The patient was found the positive for the wild-type strains and has been diagnosed with the two separate wild type asymptomatic infections (P [4] and P [6]), that was detected in three sequential stool specimens. [In this study, Vaccine take was defined as detection of post-vaccination fecal vaccine shedding by real-time reverse transcription polymerase chain reaction with sequence confirmation or plasma rotavirus-specific immunoglobulin A (RV-IgA) seroconversion 4 weeks following the 2nd dose. The vaccine take occurred in 62 high-dose infants versus 69 standard-dose infants. The plasma was collected from all infants pre-vaccination at 6 weeks and again 4 weeks post-dose 2 at 14 weeks for RV-IgA measurement by enzyme immunoassay (EIA). Seropositive was defined as RV-IgA equal or more than 20 U/mL. Seroconversion was defined as seronegative at week 6 pre-vaccination, converting to seropositive post-vaccination at week 14. Infants who were seropositive at week 6 were therefore considered negative for seroconversion analyses but included in analyses for post-vaccination seropositivity. RV-IgA EIA was performed in the research laboratory of the principal investigator. The stool specimens were collected by home visit within 3 days prior to each vaccine dose and 3-4 days, 6-7 days, and 13-14 days after 1st dose and 3-4 days, 6-7 days, and 13-16 days after 2nd dose 2. All stool specimens underwent total nucleic acid extraction with spiking of MS2 phage as RNA extraction. All extracts were tested for RV by qRT-PCR targeting the RV NSP3 gene segment. Amplification was performed on the CFX96 platform by using Ultraplex 1-step ToughMix. ST3-strain NSP3 was cloned into pFastBac1 and serial dilutions of known copy number. Positive specimens subsequently underwent conventional RT-PCR to amplify the RV VP8 gene segment followed by Sanger sequencing using VP4F and/or VP4R primers and BLAST analysis to confirm Rotarix vaccine-strain virus. Fecal vaccine shedding was defined as detection of vaccine strain virus in any scheduled post-vaccination stool specimen by quantitative real-time reverse transcription polymerase chain reaction (qRT-PCR) followed by vaccine strain sequence confirmation. PCR-positive surveillance stool specimens were also tested for RV antigen using the ProSpecT RV microplate EIA. Stool extraction, qRT-PCR, and stool EIA was performed. Positive specimens were transferred for RT-PCR in the laboratory of the principal investigator followed by Sanger sequencing by the core

facility. Active diarrheal surveillance was initiated upon enrollment until study completion at 14 weeks of life. A diarrheal episode was defined as three or more abnormally loose stools (as determined by caregivers) within a 24-hour period. Specimens for each diarrheal episode were collected by home visit and tested for RV using both antigen and PCR detection. 41 infants in the standard-dose arm seroconverted following vaccination, compared to 42 infants in the high-dose Arm. Similar results were observed when the frequency of infants who were seropositive post-vaccination at week 14 (irrespective of baseline RV-IgA) was compared between groups: 42 infants in the standard-dose arm were seropositive post-vaccination compared to 46 infants in the high-dose arm. The overall frequency of fecal vaccine shedding by PCR detection was (N = 118). The kinetics of RV shedding, relative to each dose of Rotarix, by Using PCR detection, 63 infants in the standard-dose arm demonstrated fecal shedding of Rotarix vaccine in any stool specimen at any time point following vaccination, compared to 55 infants in the high-dose arm. After conducting the post-hoc analysis among participants with confirmed vaccine replication, following the first dose, 36 infants in the standard-dose arm had confirmed vaccine replication, compared to 29 infants in the high-dose arm. Following the second dose, 14 infants in the standard-dose arm had confirmed vaccine replication, compared to 17 infants. All PCR-positive specimens underwent stool RV antigen test by EIA. The limit of detection of typical stool RV antigen EIA was approximately 106 particles/mL, whereas the standard dose of Rotarix contains a 106.5 cell culture infective dose (CCID50) of virus, which corresponds to 106 fluorescent focus units (FFU). Detection by EIA only occurs following replication, which achieves stool viral concentrations equivalent to or in excess of the initial inoculum. The 33 patients had Rotarix sequence-confirmed specimens that were also EIA-positive: 19 in the standard-dose arm, compared to 14 in the high-dose arm. Among all PCR-positive stool specimens, 22 were positive for wild-type strains: 2 untypeable, 3 P [4], 3 P[6], and 14 P [8]. Nineteen infants (9 standard-dose, 10 high-dose) had wild-type asymptomatic infections, 10 of whom also shed Rotarix at other time points. One infant had two separate asymptomatic infections (P [4] and P [6]), and another had a single episode of asymptomatic P [4] infection that was detected in three sequential stool specimens. Among the nine who did not shed Rotarix, seven seroconverted, (three standard-dose, four high-dose), meaning seroconversion waslikelydueto natural infection and not vaccination.]. This case was considered of vaccination failure. This case has been considered as serious due to vaccination failure. Treatment was unknown. The outcome of the event was not provided. [In this study, the pre-specified primary outcome was vaccine take, defined as either RV-IgA seroconversion or detection of sequence-confirmed fecal vaccine shedding in any post-vaccination surveillance stool specimen, as described. The pre-specified secondary outcomes were RV-IgA seroconversion alone and fecal vaccine shedding alone. Additional post-hoc assessments were performed to assess RV-IgA seropositivity and three- and four-fold rise in antibody concentration following vaccination, frequency of fecal shedding specimens positive by stool RV antigen EIA, vaccine take using EIA-positive fecal shedding specimens, and to identify infants with confirmed replication of vaccine-strain virus. For vaccine replication analysis, they identified all infants with sequence-confirmed Rotarix shedding, but who demonstrated increasing stool viral burden (as evidenced by lower Cq values) in sequential stool specimens following either vaccine dose (i.e. lower Cq at day 6-7 or 2 weeks compared to Cq at day 3-4 or day 6-7]. The author commented, "Thus, it was unclear if an increased inoculum of vaccine could improve vaccine response, as assessed by vaccine ??take" (a composite measure of either post-vaccination antibody seroconversion or fecal vaccine shedding) in children in low-income countries. We did detect modestly elevated RV-IgA GMC in the high-dose group (116.3 U/mL vs 89.0 U/mL among seropositive infants). Overall, our results are consistent with the finding that oral vaccine immunogenicity, both in terms of frequency of RV-IgA seroconversion and of achievable antibody concentrations, are substantially lower in low-income countries. In contrast, we did observe in post-hoc analysis that children with vaccine replication or EIA-positive shedding had significantly higher RV-IgA responses, with RV-IgA GMC

of 56.3 U/mL among children with confirmed vaccine replication vs 13.4 U/mL in those without, and GMC of 63.0 U/mL in those with EIA-detectable fecal shedding vs 21.7 U/mL in those without. The association between increased immunogenicity with vaccine replication. We defined vaccine replication via detection of increasing stool virus burden over time, which could only be achieved by viral replication. Using PCR detection allowed us to identify children with low-level replication that may have been below the limit of detection of stool EIA. Our results further confirm that the poor response to oral vaccines in low-income settings is strongly influenced by inability to successfully establish replicating gut infection, possibly due to impaired gut health and function. Since the current study used Rotarix, our results may not be generalizable to other vaccines. And finally, since RV-IgA is a suboptimal correlate of risk and vaccine efficacy in low-income countries, it is conceivable that increased inoculum could have had an effect on clinical protection that could not be captured within the scope of this study. However, we confirmed the role of vaccine-strain virus replication in enhanced immunogenicity, underscoring the importance of underlying gut health in responses to vaccine." The author concluded, "Administration of double the standard dose of an oral, live-attenuated rotavirus vaccine (Rotarix) did not improve vaccine take among infants in specific urban area. However, improved immunogenicity in children with vaccine replication irrespective of initial inoculum provides further evidence for the need to promote in-host replication and improved gut health to improve oral vaccine response in low-income settings". This is 1 of the 2 valid cases reported in this literature article. Lab Comments: On unspecified date between 12th June 2017 to 7th June 2018, lab test were done. The patient''s stool sample and plasma specimen has been taken for the RV-IgA measurement by enzyme immunoassay (EIA). The stool specimens were tested for RV by qRT-PCRa and positive specimens subsequently underwent conventional RT-PCR to amplify the RV VP8 gene segment followed by Sanger sequencing using VP4F and/or VP4R primers and BLAST analysis to confirm Rotarix vaccine-strain virus. The patient was found the positive for the wild-type strains and has been diagnosed with the two separate wild type asymptomatic infections (P [4] and P [6]), that was detected in three sequential stool specimens.

Write-up: a consumer received 2 Fluzone High Dose vaccines in one day/No AE; Initial information received on 18-Oct-2019 regarding an unsolicited valid non-serious case received from other health professional. This case involves patient of an unknown demographics who received two doses of vaccine INFLUENZA USP TRIVAL A-B HIGH DOSE SUBVIRION VACCINE [FLUZONE HIGH DOSE] lot number not reported via unknown route in unknown administration site on an unknown date. The patient''s past medical history, medical treatment(s), vaccination(s) and family history were not provided. It was a case of actual medication error due to extra dose administered. It was given in a nursing home. Pharmacist do have a note saying that some guy was given two doses of Fluzone High-Dose vaccine in the same day. At the time of report no adverse event was reported. This suspected adverse reaction report is submitted and classified as a medication error solely and exclusively to ensure the marketing authorization holder''s compliance with the requirements set out in Directive 2001/83/EC and Module VI of the Good Pharmacovigilance Practices. The classification as a medical error is in no way intended, nor should it be interpreted or construed as an allegation or claim made by the marketing authorization holder that any third party has contributed to or is to be held liable for the occurrence of this medication error. Information on the batch number was requested.

CDC Split Type:
Write-up: Patient had never had a flu shot before, was not allergic to eggs, was feeling well today and had never had Gillian-Barre Syndrome. He received his shot and sat with my for 15 min. Reported feeling fine and left. Following the above incident, he returned to the room stating ?I think I?m having a reaction, I feel like I?m tripping on acid, I feel off, my vision is blurry and I feel dizzy?. I cleared the room, one employee choose not to leave, patient said it was fine. Employee who did not leave reported that he was a first responder and wanted to stay in case I needed anything. BP was 132/82, pulse was regular. Pupils were equal, round and reactive. Lung and heart sounds WNL. No other symptoms. Patient sat with me for a bit, then said he was going back to his office. I requested that he let someone nearby know how he is feeling and let them check in on him, he said he would. He returned to the room during the clinic and said he was a bit better. Following the completion of the clinic, I checked in with him. Reported still having difficulty with his vision and felt off, but was OK, ?I do have an issue with vertigo, cutting caffeine out has helped. I still feel like I?m looking through things and not at them? Reported being in treatment for 2 years for this issue, unable to find a cause. I requested that he notify his PCP today and report the reaction, as well as not driving himself if he continued to have difficulty seeing. Also recommended future vaccinations be administered at his medical home for observation following.

Write-up: Hair is thinning; This case was reported by a consumer and described the occurrence of hair thinning in a adult patient who received Herpes zoster (Shingrix) for prophylaxis. Previously administered products included Prednisone with an associated reaction of alopecia (about 2 years ago from the reporting date). On an unknown date, the patient received Shingrix at an unknown dose. On an unknown date, unknown after receiving Shingrix, the patient experienced hair thinning. On an unknown date, the outcome of the hair thinning was unknown. The reporter considered the hair thinning to be possibly related to Shingrix. Additional details were provided as follows: The age at vaccination was not reported. The age group was not reported but it was selected as adult as per vaccine indication. The patient asked was there a corticosteroid in Shingrix. The reason the patient asked was that the patient had noticed that hair was thinning and the only thing the patient could think of that might be causing it was Shingrix, as the patient was not taking any new medications. The patient knew that when the patient was on Prednisone, it caused the patient''s hair to thin for a while, but fortunately, about six months after the patient finished taking the Prednisone, the hair came back to the way it was before.

Write-up: For a month the patient has experienced limited range of motion in her left arm, along with soreness. She has tried icing and stretching with little results. Patient says the pain has decreased by about 50% since the shot but still has limited motions in activities such as yoga. Patient is following up with her primary car physician.

CDC Split Type:
Write-up: Received vaccine Thursday at 8:10 am and by approximately 8 pm was feeling body aches. The body aches intensified during the night and when I got up at 6:00 am Friday had a temperature of 102.2 orally and felt lightheaded, weak headache, significant joint and muscle pain . Took 400 mg Ibuprofen by 11:00 am temperature dropped to 101.4. Took additional 400 mg Ibuprofen and temperature dropped to 100.6 by 3 pm. 8 pm temperature rose to 101 with worsening body aches, took 400 mg ibuprofen at that time and awoke at 1:30 am Saturday and was diaphoretic with temperature of 99. Body aches significantly improved, but not resolved. As of 4 pm on Sat improved. I did not call the doctor about the above, but I think it is very important that you know that there are people who have significant adverse reactions to vaccines and that your data should reflect rather than minimizing the side effects of vaccines.

CDC Split Type:
Write-up: experienced: some localized itching at the site of the injection, but no hives, followed by more generalized itching (still no hives). Then I started to feel really congested and could feel quickly worsening sinus pressure, which put pressure in my ears, thus making me feel a little dizzy. But that was where things maxed out and it got better from there. I took a Zyrtec and Aleve and am mostly back to normal. Not sure if it was a reaction to the vaccine itself or something I was exposed to in the process. I do have some environmental allergies and sensitivities, so perhaps that was a factor.

Write-up: consumer received a partial dose of the Pentacel described as the consumer only receiving the Dtap-IPV portion and not the ActHIB, no AE; Initial information received on 08-Nov-2019 regarding an unsolicited valid non-serious case received from a nurse. This case involves an unknown age patient who received a partial dose of the DIPHTHERIA/TETANUS/5 HYBRID AC PERTUSSIS/IPV(MRC5)/HIB(PRP/T) VACCINE [PENTACEL] (lot, expiry date, route and site was not reported) as only receiving the DTAP-IPV portion and not the ACT-HIB, on 07-Nov-2019. The patient''s past medical history, medical treatment(s), vaccination(s) and family history were not provided. It was an actual medication error due to inappropriate reconstitution technique. At the time of reporting the patient had no adverse event. This suspected adverse reaction report is submitted and classified as a medication error solely and exclusively to ensure the marketing authorization holder''s compliance with the requirements set out in Directive and Module VI of the Practices. The classification as a medical error is in no way intended, nor should it be interpreted or construed as an allegation or claim made by the marketing authorization holder that any third party has contributed to or is to be held liable for the occurrence of this medication error.

Information on the batch number was requested.

Write-up: swelling; Area appeared filled with fluid; This case was reported by a consumer via call center representative and described the occurrence of eye swelling in a 51-year-old female patient who received Herpes zoster (Shingrix) for prophylaxis. On 9th December 2019, the patient received the 1st dose of Shingrix. In December 2019, 36 hrs after receiving Shingrix, the patient experienced eye swelling and edema. On an unknown date, the outcome of the eye swelling and edema were recovering/resolving. It was unknown if the reporter considered the eye swelling and edema to be related to Shingrix. Additional details were provided as follows: The patient received dose of Shingrix in the left arm. The patient had swelling under both eyes and area appeared filled with fluid. The patient observed when woke up at 4 am on tuesday morning, but thought that it started in the night before. Till the time of reporting, the eye swelling and edema were recovering but not completely resolved. The reporter consented to follow up.

Write-up: No additional adverse symptoms reported; 15-month old patient was inadvertently administered an additional dose of MMR II; This spontaneous report has been received from a physician, referring to a 15 months old patient. The patient''s pertinent medical history, concomitant medication and drug reactions/allergies were not provided. In November 2019 (reported as 3 months ago), the patient was initially vaccinated one dose of measles, mumps, and rubella (wistar ra 27-3) virus vaccine, live (M-M-R II) (strength, frequency, lot# and expiration date were unknown) subcutaneously for prophylaxis at the 12-month well-check visit. On 25-FEB-2020, the patient was inadvertently vaccinated an additional dose of measles, mumps, and rubella (wistar ra 27-3) virus vaccine, live (M-M-R II) (strength, frequency, lot# and expiration date were unknown) subcutaneously for prophylaxis for their 15-month check-up (inappropriate schedule of product administration). No additional adverse symptoms were reported.

Write-up: inconsolable; pain; crying; body twitching; This case was reported by a physician via call center representative and described the occurrence of emotional distress in a 18-month-old female patient who received DTPa (Infanrix) (batch number 2C7F9, expiry date 9th February 2021) for prophylaxis. On 15th October 2019, the patient received Infanrix. On 15th October 2019, less than a day after receiving Infanrix, the patient experienced emotional distress, pain, crying and muscle twitching. On an unknown date, the outcome of the emotional distress, pain, crying and muscle twitching were recovered/resolved. It was unknown if the reporter considered the emotional distress, pain, crying and muscle twitching to be related to Infanrix. Additional details were provided as follows: The patient received Shingrix and felt inconsolable, pain, crying and body twitching. The side effects lasted for 72 hours and resolved. The reporter consented to follow up.

Write-up: developing excess mucus dripping down the back of her throat "like motor oil" every time she eats and drinks; This is a spontaneous report from a contactable Consumer (patient). A female patient of an unspecified age received one dose of pneumococcal 13-val conj vac (dipht crm197 protein) (PREVNAR 13) at single dose on 02Jun2015 and on 08Oct2015 for immunization, one at a drugstore and the other at a doctor''s office. The patient medical history and concomitant medications were not reported. On an unspecified date she started developing excess mucus dripping down the back of her throat "like motor oil" every time she eats and drinks. She received lots of medical advice, regarding the mistake with the administration. Could the excess mucus be a side effect? Her phamacist looked up the side effects, and it is not listed as one. The outcome of event unknown. The patient queried whether there was a difference between Prevnar and Prevnar 13. No follow up attempts are needed, information about lot/batch number cannot be obtained.

Other Medications: Pediatric Multivitamin (Gummies girls multivitamins) once daily.
Current Illness: None
Preexisting Conditions: None
Allergies: NKA
Diagnostic Lab Data: After speaking with the patients mother it was recommended that the patient present to Urgent Care today for further evaluation.
CDC Split Type:
Write-up: Spoke with patient''s mother at approximately 2:30pm the following day after the immunizations. Mom reports that the patient screamed as she was getting the vaccines and didn''t stop crying for hours, and this is not typical at all for the patient with vaccines. Mom reports that last evening she had a low grade fever (did not have specific #), and kept complaining of pain in the site of the MMRV. Mom reports localized 2 inch area of redness around the MMRV injection site. More concerning patient slept until 1pm today, only urinated once in almost 18 hr period. Patient has fever of 104.5F, reduced with Tylenol 1 hr after administration and currently at 100F. Patient also complaining of neck pain. Hurts to tilt neck back to drink small dose cup of Tylenol. No appetite, not wanting to drink. Low energy.

Write-up: Guillain-Barr?; This case was reported by a pharmacist via call center representative and described the occurrence of guillain barre syndrome in a 33-year-old male patient who received Hepatitis B vaccine for prophylaxis. Co-suspect products included INFLUENZA

VACCINE for prophylaxis. In March 1991, the patient received Hepatitis B vaccine (intramuscular) and INFLUENZA VACCINE. On an unknown date, between 1 and 2 weeks after receiving Hepatitis B vaccine and 1 week after receiving INFLUENZA VACCINE, the patient experienced guillain barre syndrome (serious criteria GSK medically significant). On an unknown date, the outcome of the guillain barre syndrome was recovered/resolved. It was unknown if the reporter considered the guillain barre syndrome to be related to Hepatitis B vaccine. Additional details were reported as follows: The case was reported by patient"s wife. The patient had guillain barre syndrome approximately 1 to 2 weeks after receiving a flu shot and a hepatitis B vaccine in March 1991. The clinical staff associated guillain barre syndrome with the flu vaccine. Brand name and manufacturer of flu vaccine was unknown. It was unknown if the reporter considered the guillain barre syndrome to be related to influenza vaccine.

CDC Split Type:
Write-up: migraine within hours of vaccine that lasted three days. Nausea that began during the night that I got the vaccine--I vomited approximately 4 - 9 am. The day after the vaccine I experienced a herpes outbreak, the first in over a decade. I am still dealing with that outbreak six days later. I think the immune system gets so stressed responding to the vaccine that anything else latent in the body has time to rear up. That is what seems to be happening for me and others.

Write-up: patient who was back for second Imovax injection, the first being 24 days ago, no AE; Initial information received on 25-Sep-2020 regarding an unsolicited valid non-serious case from a nurse. This case involves a 18 years old female patient who was vaccinated with first dose of RABIES (HDC) VACCINE [IMOVAX RABIES] vaccine and the patient came back for second dose after 24 days of first dose administration (PT:inappropriate schedule of product administration). Medical history and concomitant medications were not reported. On an unknown date, the patient received the first dose of RABIES (HDC) VACCINE and on 31-Aug-2020, the patient also received 0.5 ml of the second dose of same vaccine (injection,lot number and expiration date were not reported for bot the regimens) via unknown route in unknown administration site for unknown indication. It was an actual medication error case due to inappropriate schedule of vaccine administration . No adverse event reported at the time of reporting. This suspected adverse reaction report is submitted and classified as a medication error solely and exclusively to ensure the marketing authorization holder''s compliance with the requirements set out in Directive 2001/83/EC and Module VI of the Good Pharmacovigilance Practices. The classification as a medical error is in no way intended, nor should it be interpreted or construed as an allegation or claim made by the marketing authorization holder that any third party has contributed to or is to be held liable for the occurrence of this medication error. There will be no information on the batch number for this case.

CDC Split Type:
Write-up: Painful arm into neck, Headache, Fatique, Rapid heart beat, Palpitations, Skipped Heart Beats Told by pharmacist to contact primary care physician. Got sent to Clinic where an EKG was taken, skipped heart beats noted. Got sent to Emergency Room and monitored for 2-3 hours. Rapid heart beat slowed down as did palpitations that night which was the 3rd day after vaccine was given. Was then referred to Cardiologist who detected skipped heart beats but said I was healthy and not to be concerned. He suggested not getting another Pneumo Vaccine. Though most of the reactions ceased after third day I still have skipped heart beats and palpitations at times.

Write-up: shingles; Information has been received from a lawyer regarding a case in litigation and refers to a patient of unknown age and gender. No information was provided regarding medical history, concurrent conditions, or concomitant medications. In 2018, the patient was inoculated with zoster vaccine live (ZOSTAVAX) (strength, dose, dose number, route, anatomical site of vaccination, lot number and expiration date were not provided) as prescribed and/or administered by a healthcare provider for the long-term prevention of shingles and/or zoster-related conditions. On an unknown date (reported as subsequent to patient''s zoster vaccine live (ZOSTAVAX) inoculation), the patient was treated by a healthcare provider for shingles (herpes zoster). On an unknown date, the patient was admitted to the hospital due to the event. As a direct and proximate result of patient''s use of the zoster vaccine live (ZOSTAVAX) vaccine, the patient had and would continue suffer ongoing injuries, including but not limited to: mental and physical pain and suffering; medical care and treatment for these injuries; significant medical and related expenses as a result of these injuries, including but not limited to medical losses and costs include care for hospitalization, physician care, monitoring, treatment, medications, and supplies; diminished capacity for the enjoyment of life; diminished quality of life; increased risk of premature death, aggravation of preexisting conditions and activation of latent conditions; and other losses and damages; and would continue to suffer such losses, and damages in the future. At the time of this report, the outcome of herpes zoster was unknown. The lawyer considered the event to be related to zoster vaccine live (ZOSTAVAX).

Diagnostic Lab Data: NA
CDC Split Type:
Write-up: Expired vaccine administered. Vaccine expiration date was 6/30/2020., vaccine administered on 10/14/2020. Patient denied negative reaction after administration, no signs/symptoms of a reaction. Per recommendation of a website, repeat vaccine should be administered. Based on that recommendation the visit provider will contact the patient to disuss/ arrange repeat clinic visit for a second vaccine.. What should we do if a dose of expired vaccine is given to a patient? The dose should be repeated. If the expired dose is a live virus vaccine, you should wait at least 4 weeks after the previous (expired) dose was given before repeating it. If the expired dose is not a live vaccine, the dose should be repeated as soon as possible. If you prefer, you can perform serologic testing to check for immunity for certain vaccinations (e.g., measles, mumps, rubella, varicella, and hepatitis A).

Write-up: could not get her 2nd dose/ because the vaccine was not available; This case was

reported by a consumer via call center representative and described the occurrence of product supply issue in a 62-year-old female patient who received Herpes zoster (Shingrix) for prophylaxis. Previously administered products included Shingrix (1st dose received in September 2018). On an unknown date, the patient received the 2nd dose of Shingrix. On an unknown date, unknown after receiving Shingrix, the patient experienced product supply issue. On an unknown date, the outcome of the product supply issue was unknown. Additional details were provided as follows: The age at vaccination was not applicable for this report. Lot and expiration date of Shingrix vaccine was unknown. The patient reported that, she never completed the series of Shingrix vaccination as she could not get her 2nd dose because it was not available during that time, which led to product supply issue. The patient did not consent to follow-up.

Preexisting Conditions: Medical History/Concurrent Conditions: Palpitation (during menopause)
Allergies:
Diagnostic Lab Data: Test Date: 202007; Test Name: EKG; Result Unstructured Data: (Test Result:see text,Unit:unknown); Comments: EKG- showed dysrhythmia: sinus arrhythmia and possible right bundle branch block.
CDC Split Type: USGLAXOSMITHKLINEUS202020
Write-up: palpitations; Fatigue; chills; Malaise; Heat at the injection site; Local discomfort / Injection site; Sinus arrhythmia; Possible right bundle branch block; Thickened endometrium; Dysrhythmia; This case was reported by a nurse via call center representative and described the occurrence of dysrhythmias in a 76-year-old female patient who received Herpes zoster (Shingrix) for prophylaxis. The patient''s past medical history included palpitation (during menopause). Concurrent medical conditions included eyeglasses wearer, endometrial cancer and ovarian adenocarcinoma. On 10th July 2020, the patient received the 1st dose of Shingrix (intramuscular).

On 10th July 2020, less than a day after receiving Shingrix, the patient experienced injection site warmth and injection site discomfort. On 11th July 2020, the patient experienced fatigue, chills and malaise. On 12th July 2020, the patient experienced palpitation. In July 2020, the patient experienced dysrhythmias (serious criteria GSK medically significant), sinus arrhythmia, right bundle branch block and endometrial thickening. In July 2020, the outcome of the injection site warmth, injection site discomfort, fatigue, chills and malaise were recovered/resolved. On 14th October 2020, the outcome of the palpitation was recovered/resolved. On an unknown date, the outcome of the dysrhythmias, sinus arrhythmia, right bundle branch block and endometrial thickening were unknown. It was unknown if the reporter considered the dysrhythmias, injection site warmth, injection site discomfort, sinus arrhythmia, right bundle branch block, fatigue, malaise, palpitation and endometrial thickening to be related to Shingrix. The reporter considered the chills to be related to Shingrix. Additional information was provided as follows: The case was reported by patient her self who was a retired nurse. The patient received vaccine intramuscularly in the left deltoid. The patient experienced local discomfort and heat at the injection site which resolved. On Saturday 11th July 2020 the patient experienced chills and fatigue/malaise. On Sunday evening 12th July 2020 the patient began experiencing palpitations. She mentioned that she was not sure if the palpitations were related to the Shingrix or not because she had other stressors (she learned that her husband had cancer). On 28th July 2020 she learned the results of her Dilation and Curettage which was that she had a thickened endometrium which required a hysterectomy. An EKG (Electrocardiogram) was done which showed dysrhythmia, sinus arrhythmia and possible right bundle branch block. Due to the results of the EKG and because the palpitations had not yet resolved her hysterectomy surgery had to be postponed. She did have the hysterectomy surgeryon 14th October 2020. The palpitations had stopped by 14th October 2020. There were no complications during surgery, there was no dysrhythmia during the surgery. The patient had endometrial cancer and possible adenocarcinoma of the ovary as well. She might require chemotherapy. She had not yet had a follow up EKG but she was scheduled to have one. The reporter consented to follow up.

CDC Split Type:
Write-up: While having my flu vaccination at approximately 9:30 AM on Ocotber 16, 2020, I thought she seemed to be a bit high with the placement of the needle, but since I do not look, I could not see. It felt a bit "thick" going in, but I was not sure what that meant. Within a few hours of having the injection, my muscle felt a bit sore - which is the usual reaction - but by midafternoon 3:30 pm, there was this very intense pain on the front of my shoulder, that did not feel muscular. It intensified into the evening until I went to bed around 9 pm and took 600MG of Advil to calm the pain. I awoke around 2:30 with such pain in front of my arm, I was awake for about an hour and then took 400 mg of Advil to return to some unrestful sleep as I could not get comfortable. This has continued every night since - icing the front of my shoulder and taking 600 mg of Advil before sleep and then being awakened between 2-3:30 am due to the pain in my arm. It is difficult to get comfortable even with the ice and Advil. During the day on Saturday 10/17, Sunday 10/18 the pain was evident all day but most excruciating when I attempted to move my right arm back - to put my hand in my right pant or jacket pocket or to pull up my pants on the right side. Additionally, I could not buckle with my right hand but had to reach over with my left. There were times over those two days and every day since that moving my right arm just the slightest ?wrong way? causes such excruciating pain, it takes my breath away. On Monday 10/19 I called to make a doctor?s appointment, but they could not see me for two days. I already had a previously schedule PT appointment for Wednesday 10/21, that I did not need for the previous issues but decided to keep it and have MPT examine my shoulder and arm and make a diagnosis. She examined me and wrote her observations which can be obtained at Physical Therapy. She recommended to ice it whenever it hurts and limit any range of motions that aggravated it but to do hanging circles to keep the shoulder moving and reduce the risk of frozen shoulder. We made a follow-up appointment for 10/26. 10/25/20 The pain continues every day and night and has severely restricted my active lifestyle. It has also interrupted any sense of restful sleep as I am aware of the pain every time I turn over and awakened every morning between 2-3:30AM. This lack of restful sleep severely affects my ability to be clearheaded and productive in my job. 10/26/20 I visited Physical Therapist again today at 7:45 am. She did some laser therapy and some message and taped it with KT tape. She believes that either a tendon or bursae were struck with the needle and that is what is causing the pain. She also explained that this could be a 4-6-week recovery. My shoulder felt calm when I left PT and for about 7 hours. If is now fatigued and had some ? toothache? pain radiating out.

CDC Split Type:
Write-up: Starting within an hour of vaccination, I had major soreness in upper arm and had difficulty lifting arm. This is normal for me for the 2 days after vaccination but my pain is still consistent on 10/28 - 18 days after the injection. Pain moving, pushing, pulling, lifting, twisting across upper arm directly below tip of shoulder bone that affects everything I do. I tried taking the NP recommended does of 600mg 3x a day of ibuprofen for 5 days and did not feel any change besides a slight dulling of the pain. Today, 10/28, I began the NP prescribed Prednisone which I will take for 5 days. I had no pain before this injection.

Write-up: tiredness; headache; stomach upset; Feeling of chills; pharmacist gave the shingrix vaccine it was hurting and the pain; Arm is sore, painful/ leg ache; Arm is sore, painful and slightly red; This case was reported by a consumer via call center representative and described the occurrence of injection site pain in a 72-year-old female patient who received Herpes zoster (Shingrix) for prophylaxis. Concomitant products included Flu Seasonal QIV Dresden (Influenza vaccine Quadrivalent 2020-2021 season). On 22nd October 2020, the patient received the 1st dose of Shingrix. On 22nd October 2020, immediately after receiving Shingrix, the patient experienced injection site pain, pain in extremity and erythema of extremities. On 23rd October 2020, the patient experienced tiredness, headache, upset stomach and chilliness. On an unknown date, the outcome of the injection site pain, pain in extremity, erythema of extremities, tiredness, headache, upset stomach and chilliness were unknown. It was unknown if the reporter considered the injection site pain, pain in extremity, erythema of extremities, tiredness, headache, upset stomach and chilliness to be related to Shingrix. Additional details were reported as follows: This case was reported by patient for herself. On 20th October 2020, the patient received Flu vaccine in left arm. On 22nd October 2020, the patient received the first dose of the Shingrix in her right arm. The patient stated when the pharmacist gave the Shingrix it was hurting, and the pain continued and now the right arm was sore, painful and slightly red. On the day of reporting, 1 day after receiving Shingrix, the patient woke up with feeling of chills, stomach upset, headache, leg ache and tiredness. The reporter consented to follow up.

Write-up: Shipment had been in transit to long with no AE; Initial information regarding an unsolicited valid Non-serious case was received from a pharmacist via The Agency (Reference number- 00325402) and transmitted to Sanofi on 21-Oct-2020. It was reported that a 77-year old female patient who received INFLUENZA QUADRIVAL A-B HIGH DOSE HV VACCINE [FLUZONE HIGH-DOSE QUADRIVALENT (lot number: UJ546AA, expiry date: 06/30/2021, Route: Via intramuscular in the right arm) which received delay shipment (Product distribution issue) on 19-oct-2020 and vaccine will administrated as soon as they received for prophylactic vaccination. The patient''s medical history, past medical treatment, vaccination, concomitant medication and family history were not provided. It was an actual medication error case due to product shipment delay. At the time of reporting, no adverse event was reported. This suspected adverse reaction report is submitted and classified as a medication error solely and exclusively to ensure the marketing authorization holder''s compliance with the requirements set out in Directive 2001/83/EC and Module VI of the Good Pharmacovigilance Practices. The classification as a medical error is in no way intended, nor should it be interpreted or construed as an allegation or claim made by the marketing authorization holder that any third party has contributed to or is to be held liable for the occurrence of this medication error.

CDC Split Type:
Write-up: Around 3:00 AM I woke up shivering. The shivering was severe although I didn''t feel all that cold. It was borderline uncontrollable and it was difficult to walk (and I had an accident on the way to the bathroom). I have never had a similar reaction to a flu vaccination before, though I have received them yearly for decades. In addition, the usual level of arthritic pain I have in my shoulders and hips was exacerbated. I fell asleep in perhaps two hours after putting a heating pad on my chest and on one especially sore shoulder, and I was still shivering when I drifted off. I am fatigued and achey today, but feel much better than I did during the night, and not shivering.

Other Medications: No prescriptions, over-the-counter medications, dietary supplements, or herbal remedies being taken at the time of vaccination.
Current Illness: No other illnesses at the time of vaccination and up to one month prior.
Preexisting Conditions: No chronic or long-standing health conditions.
Allergies: No allergies to medications, food, or other products.
Diagnostic Lab Data: No medical tests and laboratory results related to the adverse event.
CDC Split Type:
Write-up: After his flu shot on 11/13, he was being driven home by his brother and he started seizing. He was shaking and unresponsive and urinated in the car seat. Brother pulled the car over and shook patient who came around. He was very tired afterward, and did not remember the event. He also had a seizure after a series of immunizations as a young child, but not sure which shot caused it that time. Mom thinks flu vaccine was one of the shots given that day. We will no longer give him flu shots.

Diagnostic Lab Data:
CDC Split Type:

Write-up: Patient was due for 4 month vaccines. Per Mother''s request he received 2 of the 4 month schedule vaccines. I had another nurse check vaccines to be given. We read Rotateq as Dec 20 20. Vaccines administered. When I went to enter Rotateq in the patient''s chart I could not find the LOT number. I checked Roteq again and noted the date printed was 5 Dec 2020. I immediately let the patient''s PCP know. I also went to my Supervisor and called the patient''s Mother to inform her of the incident and that son would need to repeat Rotateq. I removed the vaccine from the refrigerator and wrote expired on it and gave it to my supervisor. I also filled out an unusual occurrence form. No harm came to the child but he will have to repeat Rotateq.

Previous Vaccinations:
Other Medications: None on the day of vaccination
Current Illness: None
Preexisting Conditions: Asthma, allergies , raynauds
Allergies: Shellfish, tomatoes, string beans, and cinnamon
Diagnostic Lab Data:
CDC Split Type:
Write-up: Almost immediately to maybe 3 minutes after I received the vaccine my tongue started tingling and the sides of my tongue began to burn. I also had a slight red rash on my chest that began to burn and itch. These are similar to the reaction I have after I eat cinnamon. It wasn?t severe like my shellfish allergy where I go into anaphylactic, but it was definitely a reaction. My tongue was then slightly swollen that day into the next day. Very slightly swollen. Just enough that I noticed it because I kept biting my tongue. The burning and tingling lasted for maybe an hour after. I was slightly dizzy as well, but nothing too bad. I was seen by the ER team to make sure I didn?t go into anaphylactic and then I was allowed to return home. Others I walked by stated my face was bright red and I got very hot. Following that I had extreme exhaustion. I couldn?t even make it home without having to pull my car over to try and wake myself up. I am feeling fine now, but just wanted to make this known for study purposes. I plan on getting the second shot on 1-19-21.

CDC Split Type:
Write-up: Half an hour after receiving vaccine in left arm, my left face started with a tingling, numb feeling like when you get anesthesia from a dental procedure and it is thawing out. It was just the left side of my face, same side I got the vaccine. Could feel a dividing line in the middle of my face. It lasted with the same intensity for 3 days. It then started to subside slowly for the next 3 days and then was totally gone.

Write-up: I received the Moderna COVID vaccine on 12/29. I had some minor swelling and

soreness the first couple days after receiving the vaccine, but these symptoms both went away after a couple of days. A week later on 1/5, I noticed that the area where I had been injected was very swollen, red and itchy. It was localized to this year. There was some slight bruising around the top of where the swelling started. The area was not sore. There is still some redness and itching on 1/7 but the swelling has mostly gone down. I work in a community health center and had a PA I work with look at the reaction. I took some Benadryl as directed on 1/5 but have not treated the symptoms further.

Current Illness: Breast cancer (she is currently a breast cancer patient/she had breast cancer)
Preexisting Conditions: Medical History/Concurrent Conditions: Arthritis; COVID-19; Fatigue; Lymphedema
Allergies:
Diagnostic Lab Data: Test Date: 202012; Test Name: body temperature; Result Unstructured Data: Test Result:100.8; Test Date: 20201231; Test Name: body temperature; Result Unstructured Data: Test Result:temperature 101.7
CDC Split Type: USPFIZER INC2020521721
Write-up: 100.7 temperature/her temperature and it was 101.7; she was up all night/she didn''t sleep; It is very painful; migraines; she felt warm; joint pain; dull headache; tenderness at the injection; chills; as had joint pain and fatigue ever since her COVID-19 diagnosis in October/the arthritis has flared from it; fatigue/joint pain and fatigue are getting worse; This is a spontaneous report from a contactable consumer. A 49-year-old female received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0140), via an unspecified route of administration on the left arm on 30Dec2020 10:40 at single dose for covid-19 immunisation. Medical history included from Feb2020 and ongoing she is currently a breast cancer patient/she had breast cancer, has lymphedema in the right due to breast cancer and on 31Oct2020, she tested positive for COVID and that ever since she was positive, her joints and skin, shins and upper arms and legs are really tender, and hips, wanted to know if that is normal. Had joint pain and fatigue ever since her COVID-19 diagnosis in October. There were no concomitant medications. The patient previously took H1N1 shot and her arm got really big and they watched for cellulitis discomfort. The patient stated on Dec2020, "received the COVID-19 vaccine on 30Dec2020 and is reporting 100.7 temperature, dull headache, tenderness at the injection, chills, joint pain and fatigue. She reported that she has had joint pain and fatigue ever since her COVID-19 diagnosis in October. The patient contacted COVID, she tested positive on 31Oct2020, and still has no taste or smell, and the biggest thing right now, that ever since she was positive, her joints and skin, shins and upper arms and legs are really tender, and hips, wanted to know if that is normal. She wants to know, where it has gone into the joint, the arthritis has flared from it, from her testing positive, it will be 9 weeks tomorrow since she had COVID, and she is not 100%, and yesterday she had the COVID vaccine, her first dose, and she was up all night, her joints and muscles were in a lot of pain, but she had been like that, and this morning she took her temperature and it was 101.7. Does it mean can''t have the shot in 3 weeks? She has had health issues this year, she had breast cancer, and her oncologist wanted her to have the vaccine, but it concerns her with all the pain in her joints swelled, and wanted to know if it is a side effect due to COVID. States she is still coughing, she wants to know if Pfizer thought this was a side effect of COVID, since she tested positive in October, will she have to live like that? It is very painful. Her shot went fine at 10:40 yesterday morning, fine, but she has been experiencing stiffness and joint pain, and she contacted COVID in October, thinks this doesn''t have to do with the shot, this has been this way since October, and her husband said to ask- will it be like this since she contacted COVID, and the only thing, this morning she had a headache, but she didn''t sleep and she gets migraines it she

doesn"t sleep, and she took her temperature, she felt warm and it was 101.7. Her temperature was 101.7 about a half hour ago (31Dec2020), she takes her temperature now, states it is now 100.8. Stated that she probably needs to speak to her doctor for her questions. Got up a 1am and took Ibuprofen. Her joints were so sore from when having COVID and so she went back to sleep and slept off and on. Got up at 4am this morning with the dull headache, it was not enough to be considered a migraine, so she took another 800mg Ibuprofen. Headaches: states it is just a dull headache, she hasn"t taken Ibuprofen yet this morning, she is not a big medicine person, she is trying to see if it will go away, but if it is worse she will take migraine medicine". The outcome of "as had joint pain and fatigue ever since her COVID-19 diagnosis in October/the arthritis has flared from it", "she was up all night/she didn"t sleep", "It is very painful", "migraine" and "she felt warm" were unknown. Other events was not recovered.

Diagnostic Lab Data: I have an appointment scheduled tomorrow 1/10/21 with a doctor to address the joint pain/decreased ROM.
CDC Split Type:
Write-up: I walked in to received my first dose of the Moderna Covid19 vaccine at approx 12:20pm 1/7/21. The RN who was giving me my injection palpated the top of my shoulder and NOT my acromian process and administered the injection closer to the top of my shoulder, the vaccine did initially hurt more than a typical vaccine would when it was being administered but i thought that might have been normal. Approximately 1hr after receiving the vaccine my left shoulder joint started to have this pinching sensation in the anterior joint when I would raise my arm forward. The pain got progressively worse throughout the day with significantly decreased range of motion in that shoulder and significant pain in my shoulder joint. The pain was so bad it actually kept me from sleeping that night. I never had any muscular pain or any other symptoms beside the joint pain, which was alarming since it should have been administered into the muscle. I believe the vaccine my have been incorrectly injected into the shoulder joint or potentially a smaller muscle in the shoulder. The pain and decrease ROM is preventing me from doing most of my regular day to day activities. Today 1/9/21 has been a full 48hrs after receiving the vaccine and the joint pain has not gotten any better and my range of motion is still significantly decreased, which would prevent me from performing my tasks as an RN.

Previous Vaccinations:
Other Medications: Aviane- oral contraceptive once daily Flucticasone Nasal Spray 2 sprays into nostril once daily Zyrtec 10mg 1 tab once daily Flovent 110mcg 1 puff once daily
Current Illness: None
Preexisting Conditions: Asthma
Allergies: NKDA
Diagnostic Lab Data: None
CDC Split Type:
Write-up: I developed a headache about 1 hour after the vaccine. I developed a fever of 100.4 about three hours after my first dose of the COVID-19 shot. Shortly after this I had moderate GI upset including diarrhea, cramping for about 24 hours. Over the course of 48 hours after the vaccine I had swelling at the injection site, tenderness of the injection area to the point where I was not able to put pressure on the area or sleep on my left side and severe fatigue/malaise. All symptoms resolved after 48 hours. I am a person and wanted the reaction information to be part of the trial data.

Write-up: she has arm pain after receiving covid vaccine; This is a spontaneous report from a contactable consumer from a Pfizer-sponsored program. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number and expiry date unknown, via an unspecified route of administration on an unspecified date at a SINGLE DOSE for covid-19 immunisation. The patient''s medical history and concomitant medications were not reported. The patient called because she has arm pain after receiving covid vaccine and she wanted to know if she can take tylenol for the pain. The outcome of the event was unknown. Information on the lot/batch number has been requested.

Diagnostic Lab Data: None
CDC Split Type:
Write-up: Approximately, 25 minutes after vaccine administration the patient verbalized feeling dizzy. He was transferred from a chair to a nearby cot with feet elevated. The ER was notified and an EpiPen was on standby. Vital signs were: BP 155/69, O2 saturation 100%, and HR 125. Vitals were rechecked 5 min later and HR came down to 76. Dizziness still persisted and he complained of his hands feeling weak but grip strength was noted to be equal bilaterally. There was no indication for EpiPen so it was not used. Patient preference was to be transported to the ER for additional follow-up. In the ER vital signs continued to be monitored and patient was given 1 liter sodium chloride 0.9% fluid bolus after which the patient reported feeling much better. Patient was discharged from the ER.

Current Illness: None
Preexisting Conditions: GERD Environmental allergies
Allergies: Penicillin (tolerate augmentin) - anaphylaxis sulfa - rash

Diagnostic Lab Data: None
CDC Split Type:
Write-up: At 2000 on 1/13/21, I started to experience intense ache at the injection site, which by 2200 progressed to myalgias in my back, especially lower back, neck, and right arm. At 2300, I started to have fever/chills, up to 39 C orally. This only partially responded to Tylenol. I was not able to sleep. At 2:30 am I noticed an unusual headache, 8/10, as well as bilateral eye pain on Moving eyes side to side as well as sensitivity to light. Headache was mostly frontal, which came and went every few minutes until exactly 11:38 am on 1/14/2021, when the fever and myalgias very suddenly got significantly better. Almost exactly 24 hrs to the minute after injection. On 1/15/2021, I still have significant pain in my left arm, swelling, redness and, now, itching at the injection site. My lower back still hurts.

CDC Split Type: USPFIZER INC2021014379
Write-up: Pain at shot location; swelling; chills; headache; body aches; fatigue; This is a spontaneous report from a contactable other healthcare professional (hcp). A 55-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) first dose on 18Dec2020 13:00 (lot 121820, expiry date not reported), then second dose on 08Jan2021 15:30 (lot EK9231, expiry date not reported); both intramuscular in the left arm at a single dose for COVID-19 immunization. There were no medical history and concomitant medications. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient had no known allergies. The patient was not pregnant at the time of the vaccination. The patient had no other vaccine in four weeks and no other medications in two weeks. The vaccines were administered in a hospital. On 09Jan2021 06:30, the patient experienced pain at shot location, swelling, chills, headache, body aches and fatigue. Post vaccination, patient had COVID test nasal swab (PCR) on 05Jan2021 and the results was negative. The events were reported as not

serious (did not result in death, not life-threatening, did not cause/prolonged hospitalization, not disabling/incapacitating and not a congenital anomaly/birth defect). The patient did not receive any treatments in response to the events reported. The patient was recovering from the events pain at shot location, swelling, chills, headache, body aches and fatigue.

Diagnostic Lab Data:
CDC Split Type:
Write-up: 1 week after getting the first shot of the Moderna Covid vaccine, I am experiencing

swelling, itchiness, redness, and heat at the vaccine site. The swollen area is about 7 cm in diameter. I first noticed itchiness at the vaccination site (my left shoulder) this morning. I was aware of itchiness twice more throughout the day. And my shoulder felt thick and itchy in the evening too, so I finally looked at it in the mirror and saw that it was red and swollen.

CDC Split Type:
Write-up: 1/11-Received vaccine @ 11:55am and by 9pm my right shoulder started to hurt-centralized to the joint area. 1/12- Right shoulder pain continued to increase. Couldn''t sleep or perform normal daily functions by next morning. 1/13-Shoulder pain continued to get worse and lost more range of motion. Went to the Emergency Room @ 3:30am and was there until 11:30am the next day. Ran a number of tests below. 1/14-pain had subsided a little bit due to prescriptions from Dr. at hospital. (Robaxin, Prednisone, Ibuprofan and Tylenol). 1/15- 9am Dr. appointment with primary care physician via telehealth. Received referral for a Dr. who specializes in Ultrasound Scans. 1/16-1/18(today) Pain had continued in right shoulder, centralized to joint area with no other symptoms. Went to physical therapy this morning @ 9:30am to do range of motion tests.

CDC Split Type: USPFIZER INC2021019318
Write-up: vomiting; chills; severe headache; stomach pain x72 hrs; severe nausea; dizziness; low blood pressure; This is a spontaneous report from a contactable healthcare professional. A 48-year-old female patient started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular from 05Jan2021 10:00 to 05Jan2021 10:00 at a single dose for COVID-19. Medical history included asthma, sibo, allergies to wheat, gluten, corn, tomato and peanuts. The patient''s concomitant medications were not reported. It was reported that the patient''s initial response to shot was severe nausea and dizziness, low blood pressure lasted 24hrs on 09Jan2021. 5 days later, the patient had nausea, vomiting, chills after meal, severe headache and stomach pain 72 hrs. The patient received IV fluids as treatment for all events. The patient underwent lab tests and procedures which included Covid Nasal Swab Test on 04Jan2021 which tested negative. The outcome of the events was not recovered. Information on the lot/batch number has been requested.

CDC Split Type:
Write-up: About two weeks after I received the vaccine (almost a week ago as of present) I began experiencing rapid muscle twitches near the injection site. I can send a video if necessary. Only muscle experiencing these symptoms is one on my left shoulder, where the injection occurred. Twitches a couple times a second for a couple minutes at a time. Frequency of these events per day has increased over the past week. Presents without pain, numbness, tingling, etc. No past history of chronic muscle twitches. I am capable of fine motor movements such as writing and maintaining full motion of my arm while it occurs. Consulted with a doctor (my employer) informally and they recommended I submit this form. Willing to answer any questions that might show up.

CDC Split Type:
Write-up: Light-headed dizziness, once sittg up fell backwards had no control over my body, also when I put my head on the pillow to go to sleep it happened. Happened when I moved my head from side to side. Well walking I had to hold on to something until it passed. Some headache. I do have headaches anyway so I"m not sure if that was the cause. My concern is the dizziness and the lightheadedness and loss of control, not immediately following the vaccine but three days later. Not sure if the delay in side effects is normal.

Other Medications: melatonin 3mg daily, magnesium 500mg daily, gabapentin 300mg BID
Current Illness: none known.
Preexisting Conditions: lower extremity neuropathy
Allergies: meperidine = hives/dyspnea
Diagnostic Lab Data: Upon arrival to ED on 1/15 patient had CXR and blood work ordered. CXR showed hilar prominence and thickening paratracheal strip - recommended to get chest CT. Labwork revealed extremely low level of platelets, 11,000. Discussed with hematology who concurred it was probably ITP. Advised to admit patient, start prednisone 1 mg/kg/day and IVIG 1 g/kg/day x 2 days. On 1/16 platelets increased to 42,000 and on 1/17 they were 104,000. Patient responded well to treatment and was discharged on 1/17. At discharge plan for a slow taper of prednisosone over 4-6 weeks, weekly CBC''s and PCP prophylaxis with Bactrim. She was advised to f/u with PCP in 1 week and should consider getting lung lesion biopsy when platelet count allows.
CDC Split Type:
Write-up: Patient got her 2nd dose of Pfizer covid vaccine on 1/8. On 1/11 she had intermittent chest pain that lasted a few days and started to notice small purpura rash on left breast. She didn''t think much of it but noticed the same type of rash on her pant line and then right thigh. On 1/15 she called Occupational Health who advised her to go straight to the ED.

Previous Vaccinations:
Other Medications:
Current Illness: Asthma (diagnosed at childhood); Diabetes (diagnosed in her twenties); Overweight
Preexisting Conditions: Medical History/Concurrent Conditions: Cellulitis (about 7 or 8 years, due to the nurse not using aseptic technique but not due to a vaccine); COVID-19 (off quarantine as of 28Dec2020, going back to work on 31Dec2020); Quarantine
Allergies:
Diagnostic Lab Data: Test Date: 20210111; Test Name: temperature; Result Unstructured Data: Test Result:99.8; Test Date: 20210112; Test Name: temperature; Result Unstructured Data: Test Result:101.8; Comments: after taking antipyretics 6 hours before; Test Date: 20210112; Test Name: temperature; Result Unstructured Data: Test Result:101; Comments: Her temperature now is 101; Test Date: 20201218; Test Name: COVID; Result Unstructured Data: Test Result:diagnosed with covid
CDC Split Type: USPFIZER INC2021030718
Write-up: temperature elevated (99.8, 101.8, 101); at the injection site (upper left deltoid) she was experiencing very small redness and a sharp shooting pain; at the injection site (upper left deltoid) she was experiencing very small redness and a sharp shooting pain; She is very achy; shooting pain all the way down from her left upper deltoid to her middle and ring finger on left hand; This is a spontaneous report from a contactable nurse (patient). This 40-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EJ1686) intramuscular, in left deltoid, on 11Jan2021 at 10 AM, COVID-19 immunization. Prior vaccinations (within 4 weeks) or on the same day: none. Medical history included ongoing asthma diagnosed at childhood, ongoing diabetes diagnosed in her twenties, she was overweight, about 7 or 8 years ago she ended up having cellulitis due to the nurse not using aseptic technique but not due to a vaccine, she was diagnosed with COVID on 18Dec2020 (she was off quarantine as of 28Dec2020, going back to work on 31Dec2020). When she was diagnosed with COVID, it caused an asthma exacerbation and she needed a 5-day oral burst of 40 mg prednisone. Concomitant medications were none. On 11Jan2021 the patient experienced temperature elevated, at the

injection site (upper left deltoid) she was experiencing very small redness and a sharp shooting pain and she was very achy. Her temperature started last night (11Jan2021), temperature was 99.8. She tried to hydrate. She also had a temperature at 6 AM on 12Jan2021 morning. On 12Jan2021 she had temperature of 101.8 and this was after taking antipyretics 6 hours before. Then, on 12Jan2021, her temperature was 101. She was on the phone with her primary care provider and she was told to take more antipyretics. She just took more antipyretics. She stated it felt almost like they hit a nerve when administering the vaccine since she was experiencing shooting pain all the way down from her left upper deltoid to her middle and ring finger on left hand. She believed, based on anatomy, that there were nerves going right there. She knew she was overweight but her upper arms were not that bad. She tried to take a shower to cool herself down. She received the vaccine through pharmacy since she was working at a long term care facility around COVID. Pharmacist came to the long term care facility where she works to administer the vaccine. The events did not require ER visit. Relevant tests: none. Fever outcome was unknown. The other events had not yet resolved. Sharp shooting pain came and went. The reporter considered all the events serious as medically significant and related to BNT162B2 vaccine.; Sender''s Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Diagnostic Lab Data: I called my doctor for advice on who to call or if I should go to the ER. She suggested the ER but I took DayQuil and passed out right after our phone call. I am still experiencing shaking, not as bad after the meds, but it?s there. The the level of discomfort is unbearable. If the second shot is said to be worse than the first, and it is true, I would be hospitalized no doubt.
CDC Split Type:
Write-up: My fever was through the roof. My body ached so bad I couldn?t walk. I was on fire all over. Then came the adverse event- uncontrollable shaking. This was not a side effect written on the moderna sheet of risks. I was shaking so bad I thought I may have a seizure. I finally settled down and fell asleep. About an hour later, I woke up shaking out of control. I was going to call 911 but my partner was able to grab some NyQuil for me and knocked me out. It was the most terrifying experience of my life and I will not be getting the second shot because of it.

Current Illness: just a migraine, which is rare for me
Preexisting Conditions: anxiety, depression, chronic fatigue, mild hypertension and palpitations
Allergies: slight latex recent slight allergic reaction to something unknown (hives, mild lip swelling, pain, and redness, all on outer lips only)
Diagnostic Lab Data: None.
CDC Split Type:
Write-up: A few hours after the infection, I started having small muscle spasms all over, like little pulsations throughout my whole body, especially in legs and arms. They weren''t intense or painful, but still unsettling. It''s been happening daily, and has subsided a little but it''s still happening 5 days later. Also have very sore and tight leg muscles. I don''t know if this is considered "adverse enough", but it''s still concerning, as muscle spasms are not mentioned in the common side effects, and because it has not stopped completely.

CDC Split Type:
Write-up: When getting the injection, at the end of it, when the provider pulled out the needle, some of the vacine came out as well and dripped/ ran down my arm to my elbow. I remarked on it, as did she. She saw it happen and was aware of it, it was clearly a surprise to her. When the

vacine drops ran down my arm to my elbow, administer expressed dismay, and took her fingers and ran them over the drips, back up my arm to the injection site, and patted it , saying something like that should have gone in there. And then expressed, some kind of exclamation of surprise. Of the - oh my -, or -whoopise- variety. All of which made me think it was unusual and not right. Then she said nothing. Patted it up with a tissue. I asked, about what had happened, and she said something to the effect that she thought I had gotten enough, and was covered. If I had had more presence of mind at the time I should have asked to speak with a supervisor. Since the dose is small, I don?t know how many drops can spill and someone is still covered ? and what follow up protocol is for my situation, if there is any ?

CDC Split Type:
Write-up: No temperature prior to Vaccine. Track daily - run 97.4-97.7F normally Friday

1/22/2021: 1930 started feeling very tired 2030-2230: started to feel cold, skin sensitivity, developed into shaking chills, entire body shaking. Headache. Temperature rising 99F -- 100.4F -- - 101.5F about every 1/2hr or so. 2100 Took Advil 600mg Midnight: Chills, HOT, Temp 102.4F. Dozing off and on through the night. Shaking and Hot. Headache. Feeling Nausea 0400: Temp 101.6F, tried to take Ibuprofen but dry heaved them back up. Sips of water. Took warm shower. 0500: back to bed, slept 1 hour 0600: saltines, gingerale - took Advil 600mg - laid back down. Head throbbing. Less Nausea. 0830: woke: Temp 100.4F Headache and hot, feel achy all over never leaves, feel woozy. Spent most of Saturday 1/23/2021 (My 54 Birthday) Laying and sleeping. Started taking Tylenol 1000mg (1/23 at 6pm) alternating with Ibuprofen 600mg every 6 hours exactly. Woke Sunday Morning - feeling less achy, but still with Temp 100.4-99.6F -- As Sunday went on - by afternoon/evening achy, skin sensitive, and Temp 100.4F, HEADACHING! Neck aching. Took Ibuprofen 600mg. Drinking gingerale and water through the day. Toast. Now almost Midnight 1/24/2021 Headache and feeling achy. (Right ARM only slight hurt this time. 1st Pfizer - hurt 8/10 day 2 &3)

Current Illness: reactions to dose 1 of Moderna Covid Vaccine on 12/26/2020
Preexisting Conditions: none
Allergies: anaphylaxis to fire ants/wasps
Diagnostic Lab Data: none
CDC Split Type:
Write-up: Grade 3 systemic reactions, much worse than the first time. Injection site (right arm) pain, swelling. Overall body pain, skin, muscle joint, Fever up to 101.6 for 36 hours, now running 99.5 on day 2 post injection, nausea, diarrhea, gas, bloating, dizziness, weakness, fainting, fatigue. Unable to function or to work. Symptoms are again substantially worse than 10 other individuals vaccinated at the same time for dose 2. I suspect my reactions may be dose to weight dependent. I am a very small adult, 4''9", 123 pounds. There may be cause to consider smaller doses for smaller people. That would also allow more doses to be available for the population. I am a healthcare professional. Many lay people would probably not have been willing to take a

second dose at this level of reaction.

Preexisting Conditions: Medical History/Concurrent Conditions: Pulmonary embolism (19 years back)
Allergies:

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: Pulmonary embolism; Blue lips; Immediately after getting shot she couldn''t breath; A spontaneous report was received from a nurse who was also a female patient who received Moderna''s COVID-19 Vaccine (mRNA-1273) and experienced difficulty breathing, blue lips, shortness of breath, and pulmonary embolism. The patient''s medical history included pulmonary embolism. No relevant concomitant medications were reported. On 30 Dec 2020, moments prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (lot number 026L20A) intramuscularly for prophylaxis of COVID-19 infection. The patient began to feel like she couldn''t breathe, and her lips were blue immediately after receiving the vaccine on 30 Dec 2020. The symptoms resolved within an hour. On 05 Jan 2021, she developed shortness of breath and experienced pulmonary embolism. Treatment included apixaban. Action taken with mRNA-1273 in response to the events was not reported. The outcome of the events, difficulty breathing, blue lips, shortness of breath, and pulmonary embolism, were not reported.; Reporter''s Comments: This case concerns a female patient, nurse, of unknown age with medical history of Pulmonary embolism, who experienced a serious, unexpected event of difficulty breathing, cyanosis and pulmonary embolism. The event of difficulty breathing and cyanosis occurred immediately and pulmonary embolism occurred after 7 days after first dose of mRNA-1273 (lot number 026L20A). Based on the current available information and temporal association between the use of mRNA-1273 and the start of the event, a causal relationship cannot be excluded.

Allergies:
Diagnostic Lab Data:
CDC Split Type: USPFIZER INC2021025361
Write-up: Body aches; Chills; Headache; Pain at injection site; poor appetite; fever; This is a spontaneous report from a non-contactable other healthcare professional (patient). A 53-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3249), intramuscular (left arm) on 11Jan2021 (16:45) at single dose for Covid-19 immunization. The patient received the first dose of COVID 19 vaccine (BNT162B2, lot number: EL1284) on 21Dec2020 (05:00 PM) intramuscular (left arm) for Covid-19 immunization. The patient''s medical history included diabetic and heart disease; no known allergies. The patient''s concomitant medications were not reported. The patient was not diagnosed with COVID-19 prior to vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced body aches, chills, headache, pain at injection site, poor appetite, and fever on 12Jan2021. There was no treatment received for the adverse events. The outcome of events was recovering. The patient has not been tested for COVID-19 since the vaccination. No follow-up attempts are possible. No further information is expected.

Preexisting Conditions: Medical History/Concurrent Conditions: No adverse event (No reported medical history.)
Allergies:
Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: Looked like cellulitis; Redness had spread; Painful; Itchy; Arm became really hard and swollen; Dose above deltoid; A spontaneous report was received from a consumer concerning a 25-years-old female patient who received Moderna''s COVID-19 Vaccine (mRNA-1273) and developed hard and swelling, itchiness, redness and pain at the injection site which resembled cellulitis, and she received the vaccine in the wrong anatomical location. The patient''s medical history and relevant concomitant medications were not reported. On 04 Jan 2021, the same day as the onset of the events, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the upper shoulder joint for prophylaxis of COVID-19 infection. On 11 Jan 2021 the patient''s arm became hard, swollen, itchy, and painful. On 12 Jan 2021 the patient''s arm was red and resembled cellulitis. No treatment information was provided. Action taken with mRNA-1273 in response to the events was not provided. The outcome of the event, she received the vaccine in the wrong anatomical location, was resolved on 04 Jan 2021. The outcome of the event itchiness resolved on 12 Jan 2021. The outcome of the events swelling and pain at the injection site which resembled cellulitis were not reported..; Reporter''s Comments: This case concerns a 25 years old female patient, who experienced product administration error, and a non-serious unexpected event of limb discomfort, vaccination site cellulitis, and non-serious expected event of pruritus, pain and redness. There were no reported AEs associated with this case of product administration error. The events of limb discomfort, pruritus, and pain occurred 8 days after first dose of mRNA-1273, lot # unknown. The event of erythema, and vaccination site cellulitis occurred 9 days after first dose of mRNA-1273, lot # unknown. Treatment details was not provided. Based on the current available information and temporal association between the use of the product and onset of the events (vaccination site cellulitis, pruritus, limb discomfort, pain and redness) a causal relationship cannot be excluded.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient reported symptoms of nausea and severe lightheadedness approximately 10 minutes after vaccine administration. Symptoms progressed and patient report feeling itchy with throat tightness. New onset of rash on bilateral forearms. He was elevated by Doctor with recommendation to be transported to the local Emergency Department. Patient refused to be transported and asked to stay on-site for continued observations. Patient''s symptoms failed to resolve after 45 minutes, rescue team was called. They presented and evaluated patient with recommendations to be transported to the local Emergency Department. Patient declined transport to the hospital. Rescue team spoke with the Emergency Department, the decision was made and the patient agreed to an additional hour of observation with the understanding if symptoms didn''t resolve they would be transported to the Emergency Department. Symptoms unchanged after 1 hour, patient made the decision to leave and follow up with their Primary Care Physician.

Diagnostic Lab Data:
CDC Split Type:
Write-up: red, itchy rash in arm that started 9 days after injection. I was prescribed antibiotics, advised to use a cortisone cream, and the rash continued to grown and spread. I was advised to take Zyrtec. Rash eventually resolved. I received 2nd vaccine (in different arm) on 1/24/2021. The rash started a few days later - it was approximately 2 inches below the injection site. I have been advised to take Zyrtec. So far, the rash is less red/has not spread as much as the first.

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: Dose was given to 17 years old; A spontaneous report was received from a pharmacist

concerning a 17-years-old, male patient who received Moderna"s COVID-19 Vaccine (mRNA-1273) and patient received the vaccine at the age of 17 years old. The patient"s medical history was not provided. Concomitant product use was not provided by the reporter. On 21 Jan 2021, the patient received their first of two planned doses of mRNA-1273 (Lot number 013L20A) intramuscularly (IM) in the right arm for prophylaxis of COVID-19 infection. Pharmacist confirmed the age of the patient is 17 years old, not 15 as stated in the voicemail. She reports that the patient received the Moderna COVID19 vaccine on 21 Jan 2021 on right arm as IM injection. Patient reported no symptoms. Treatment information was not provided. Action taken with mRNA-1273 in response to the event was not provided. The outcome of the event dose was given to 17 years old was resolved on 21 Jan 2021.; Reporter"s Comments: This case concerns a 17-year-old male patient who received their first of two planned doses of mRNA-1273 (Lot number 013L20A), reporting Product administered to patient of inappropriate age without any associated adverse events.

CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: Anaphylactic reaction after first Moderna Vaccine dose; A spontaneous report was received from a pharmacist concerning a female nurse who received Moderna"s COVID-19 Vaccine (mRNA-1273) and developed anaphylactic reaction. The patient"s medical history was not provided. No relevant concomitant medications were reported. On an unknown date, prior to

the onset of the event, the patient received their first of two planned doses of mRNA-1273 intramuscularly in the arm for prophylaxis of COVID-19 infection. The pharmacist reports the patient developed an anaphylactic reaction with no other details. No treatment information was provided. Action taken with mRNA-1273 in response to the event was not reported. The outcome of the event, developed anaphylactic reaction, was considered unknown.; Reporter''s Comments: This case concerns a female patient of unknown age. The medical history is not provided. The patient experienced an unexpected event of Anaphylactic Reaction that was considered medically significant. The event occurred at unknown time after received their first of two planned doses of mRNA-1273 (Lot unknown). Very limited information regarding this event has been provided at this time. Based on temporal association between the use of the product and the start date of the event, a causal relationship cannot be excluded and the event is considered possibly related to the vaccine.

Write-up: sudden sensorineural hearing loss; This initial spontaneous report was received from a lawyer regarding a case in litigation concerning a patient of unknown age and gender. No information was provided regarding medical history, concurrent conditions, or concomitant medications. In or around 07-MAY-2012, the patient was inoculated with zoster vaccine live (ZOSTAVAX) for routine adult health maintenance and for its intended purpose: the prevention of shingles. On an unknown date, shortly after vaccination, the patient suffered sudden left side hearing loss and was diagnosed with left sudden sensorineural hearing loss. As a direct and proximate result of the zoster vaccine live (ZOSTAVAX), the patient''s symptoms have resulted in physical limitations not present prior to vaccination, also experienced mental and emotional distress due to resulting physical limitations and seriousness of his condition. Patient sustained severe and permanent personal injuries and serious, progressive, permanent, and incurable injuries, as well as significant conscious pain and suffering, mental anguish, emotional distress, loss of enjoyment of life, physical impairment and injury. At the time of this report, the patient had not recovered from the event. The reporter assessed that the event was related to zoster vaccine live (ZOSTAVAX). The reporter considered left sudden sensorineural hearing loss to be a disabling event. Upon internal review, it was considered a medically significant event.

Write-up: Rash on the left side of the neck; This case was reported by a pharmacist and described the occurrence of neck rash in a 58-year-old female patient who received Herpes zoster (Shingrix) (batch number 2LH9L, expiry date 4th October 2022) for prophylaxis. On 11th January 2021, the patient received the 2nd dose of Shingrix (intramuscular). On 14th January 2021, 3 days after receiving Shingrix, the patient experienced neck rash. On an unknown date, the outcome of the neck rash was not recovered/not resolved. It was unknown if the reporter considered the neck rash to be related to Shingrix. Additional details were reported as follows: The age at vaccination was not reported but it could be 57 or 58 years. The patient received Shingrix in the left deltoid. The batch number of Shingrix was reported as ZLH9L, which was corrected to 2LH9L as per sales data sheet. The patient developed rash on the left side of the neck and was ongoing at the time of call. The reporter consented to follow up.

CDC Split Type:
Write-up: Assessment: Individual stated he was feeling lightheaded approximately four minutes after receiving his first dose of the Pfizer vaccine via IM injection in his upper arm. Individual was seated at the time and was about to move from the vaccination station to the check out desk. PT attempted to stand and said, ?Oh, I don?t feel so good?, after which vaccinator inquired with PT on what was wrong. After a brief assessment, notified personnel of the situation. Individual remained with the vaccinator, who obtained a set of vital signs and continued an assessment. Vitals: (as I recollect, I gave the post it to the check out staffers who monitored the individual prior to his departure) BP: 126/54, P: 78, RR: 18, pale and sweating across his brow area. Denied chest pain, difficulty breathing, nausea, tingling, headache, stated only symptom was lightheaded ness which was dissipating. Provided the individual with bottled water to sip on, which he did. Individual?s last oral intake was at ~0845 PTA at the clinic, a normal breakfast of eggs, toast and coffee. Individual stated he had several cups of coffee but had not had anything else to drink that morning. Individual receives dialysis three days per week. He had an appointment Wednesday, next appointment is Friday. Individual did not have anyone driving him to the clinic, stated he would be fine and did not have anyone to come pick him up. He stated he was feeling better already. After approximately 8 additional minutes, individual stated he thought he could get up and move to the check out station. Individual was able to stand an ambulate to the check out line. Upon arrival at check out, transferred the individual to the check out personnel and Exit workers to monitor the individual?s condition for the remainder of the 30 minutes.

Current Illness: None
Preexisting Conditions: Asthma HPT
Allergies: Erythromycin, Cardizem But E topically Wasps
Diagnostic Lab Data: NA
CDC Split Type:
Write-up: After 4-5 hours I developed arm pain, malaise, headache,low grade temp, chilly feeling, head congestion, sore throat. By 0700 Tuesday, all were resolved except the arm pain and malaise. The arm pain had increased Monday evening to excruciating pain that lasted until Wednesday at noon. The pain was unrelieved by otc parents n remedies. I couldn?t sleep, walk , move my fingers, or use my arm in any way. There was no redness or swelling. I couldn?t find the puncture. I was in bed all day Tuesday because I couldn?t move my arm without intense pain. If I didn?t move it, it was a dull ache. The pain was mstly in my upper circumferentially. But moving my hand or fingers brought down to them. The pain lessened slightly on Wednesday but was still debilitating. By Wednesday evening it was greatly improved and I woke up Thursday morning pain free.

CDC Split Type:
Write-up: Pt returned to clinic after leaving the site and sitting in her car for 1-2 minutes. Per pt, she began to feel "itchy" in her right arm (vaccine administered in left) and returned to clinic c/o concern for allergic reaction. Pt initially presented to RN, who notified This RN for further assessment of the patient. Upon initial assessment, pt appeared anxious and was c/o itching in her bilateral arms, pressure and "tightness" in her chest. Approximately 3 in x 3 in area of erythema visualized to upper right arm, with 3 hives surrounding the area. No erythema visualized to vaccine site, however, 2 hives were visualized to right upper arm. No diffuse erythema or hives noted. Lungs CTA bilaterally, HR 76 w/palpation. Site Manager, and RN to pt''s side. EMS contacted. This RN waited at pt''s side for continued assessment while awaiting EMS. Electronically signed by RN at 2/5/2021 16:00

Other Medications: Bupropion XL, Ortho Tricyclen Lo, melatonin, occasional Vitamin D
Current Illness: None
Preexisting Conditions: Asthma (PRN Albuterol inhaler, not taken recently)
Allergies: Zyrtec & Claritin - had generalized urticaria lasting several days, nausea, dizziness, lightheadedness several years ago when last tried either
Diagnostic Lab Data: none, but did take pictures to document redness at 8 days, didn''t take pictures of hives . Had a physician family member look at it
CDC Split Type:
Write-up: Received around 2pm on Friday, 1/15/21. Not sure exactly when this started, but noticed redness around injection site that evening around 8pm, mildly itchy. Also felt a little bit tachycardic and anxious about 2 hrs after (4pm Friday) for 15-30 mins, but I think that may have been lack of sleep and my own nerves! But redness persisted at injection site, and had intermittent hives around injection site (smaller area within area of redness, about silver dollar sized hive area intermittently), noticed probably 5x over the next 8 days (last had hives on 1/23 PM, 8 days after). Hives were sort of raised white weals with red border. Redness persisted and began to resolve at around 10 days s/p shot, fully resolved by about 12 days s/p shot. Also seemed to have decreased appetite over that time, but also could be totally unrelated with stress

CDC Split Type: USPFIZER INC2021061687
Write-up: high fever of 101.8; body aches; headache; rigors/chills; shaking; increased pain at injection site; one instance of vomiting; This is a spontaneous report from a contactable other health professional (patient). A 30-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: El3302, via an unspecified route of administration on 20Jan2021 02:00 at a SINGLE DOSE for covid-19 immunization. Medical history included allergies to penicillin and cephalosporin. Patient received her first dose of BNT162B2 on 30Dec2020 at (12:00) (lot number: ELO140), (in the right arm) for COVID-19 immunization. Patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient hasn''t been tested for COVID-19. The patient''s concomitant medications were not reported. The patient developed a high fever of 101.8 (unit not provided), chills, body aches, headache, rigors, shaking, increased pain at injection site, and one instance of vomiting starting approximately 6 hours after her second dose (for clarification) of the vaccine (20Jan2021, 20:00). the outcome of event was reported as "recovering". the patient did not receive any treatment due to the events. The events were considered as non-serious by the reporter. No follow-up attempts are possible. No further information is expected. Information on the lot/batch number has been obtained.

CDC Split Type:
Write-up: Woke up and started vomiting around 11:30 that night(2/5.) This lasted approximately 1-2 hours. Was unable to eat anything until late afternoon on Sat. the 6th. Had a bad headache throughout and bad soreness at the injection site. Still have headache (approx. 5pm on Mon. 2/8) but soreness at injection site has almost disappeared. I do not have a primary physician so have not called anyone. Am now taking Advil for headache which helps but it returns if I stop.

CDC Split Type:
Write-up: A large circular, red, itchy lesion appeared at the vaccination site. It was swollen and hard to the touch. It grew overnight and into the next day reaching a diameter about 4 inches. It healed and disappeared after 3 days. Itchy hives on the buttocks, back, and stomach occurred at the same time, appearing each night for 6 days. Benadryl was used on nights 3 and 4, and hives persisted.

Write-up: black outs; Severe migraine; full body shakes; soured; delayed jumbled speech; loss of memory; nausea; motor control issues; This is a spontaneous report from a contactable consumer reported for herself. A 31-year-old female patient (not pregnant at the time of vaccination and event onset) received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EL3249, via an unspecified route of administration on 25Jan2021 10:00AM at single dose in right arm for covid-19 immunization, immunized in hospital. Medical history included obesity, anxiety, post-traumatic stress disorder (PTSD), insomnia, allergy to walnuts pecans. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included sertraline hydrochloride (ZOLOFT), clonidine, fish oil and multi vitamin. The patient previously received the first dose of bnt162b2 lot number: EL1284, on 04Jan2021 12:00 PM at single dose in left arm for COVID-19 immunization. The patient didn''t receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously also received morphine and codeine, experienced allergy. The patient experienced sever migraine, black outs, full body shakes, soured, delayed jumbled speech, loss of memory, nausea and motor control issues, from 26Jan2021 11:30 PM. The events resulted in emergency room/department or urgent care. It was unknown if treatment was received. The outcome of the events was recovering. Since the vaccination, the patient had not been tested for COVID-19. The case was reported as non-serious.

CDC Split Type:
Write-up: Day 1: 7 hours after the vaccine shot, I experienced mild fatigue and chills. Overnight, I had night sweats and insomnia. (Night sweats are a symptom that started after the first vaccine shot, and had dwindled until the second brought them up again). Day 2: The next morning, I experienced intense fatigue, dizziness, chills, fever, headache with light and sound sensitivity, nausea, and intense fatigue. I was unable to get out of bed most of the day. I could not sit up without intense effort to even drink water. At approximately 11am, I took 600mg Tylenol, then was able to sleep for 3 hours. When I woke up my symptoms were much better, though I still had mild fatigue and achiness. Day 3: I was mildly fatigued but otherwise felt good. Day 4: I awoke with a series of small rashes on my torso (front, back, and sides), as well as my inner arm. They were red, flat, not raised, and mildly itchy, One was around my umbilicus, a few under my breasts, and other splotched in random other places on my torso. My inner ears were also mildly itchy. I put generic rash cream on the rashes on my torso and arms, and the itchiness subsided. The redness decreased throughout the day, though they were all still visible by evening. Day 5: I awoke and my entire torso was bright red *except* the places where the rashes had been the day before, which were normal skin color. Ears are itchy again, and skin is very mildly itchy. Other than that, no other symptoms. No trouble breathing, good energy. I have never had rashes or an allergic reaction like this before. I assume it''s an allergic reaction, due to the itchy inner ears and skin.

CDC Split Type: USPFIZER INC2021076046
Write-up: bilateral feet, left worse than right, burning, itching sensation, which progressed up to her mid calves and to a slight extent in both hands; bilateral feet, left worse than right, burning, itching sensation, which progressed up to her mid calves and to a slight extent in both hands; bilateral feet, left worse than right, burning, itching sensation, which progressed up to her mid calves and to a slight extent in both hands; This is a spontaneous report from a contactable physician. A 57-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number EL3284), intramuscular into the left arm on 11Jan2021, at 16:00 as

second single dose for covid-19 immunization. Medical history included Obstructive sleep apnea from an unknown date, oligodendroglioma from 1996 (noted as history of oligodendroglioma status post resection 25 years ago with stable follow up and no residual deficits). The patient had no known allergies to medications, food, supplements or herbal remedies. There were no concomitant medications; Patient was not taking any OTC medications, prescribed medications, supplements or herbal remedies at the time as well as in the period prior to her vaccinations. The patient previously received BNT162B2 (lot number EH9899) on 22Dec2020. On 18Jan2021, at 08:00, the patient experienced bilateral feet, left worse than right, burning, itching sensation, which progressed up to her mid calves and to a slight extent in both hands, which was medically significant and had not recovered, as it was persisting. This was elaborated as follows: patient experienced one week following 2nd Pfizer covid-19 vaccine patient developed bilateral feet, left worse than right, burning, itching sensation. the symptoms progressed up to her mid calves and to a slight extent. The events were considered medically significant. Details were as follows: The symptoms were quite intense and interfered with her life, requiring gabapentin prescription for control of neuropathic complaints. Patient denied any significant weakness, low back pain, neck pain, balance problems, dizziness, bowel or bladder involvement. Patient saw physician who performed workup for common associated etiologies of polyneuropathy, which were negative. Patient underwent EMG/NCS which were normal, and subsequently skin bx (skin biopsy) to rule out small fiber neuropathy (results pending). The patient further described the incident as a week after receiving the second dose of the covid vaccine, the patient experienced new onset bilateral feet burning that went into her upper legs, mid calves and to a slight extent in both hands. The burning was experienced more in the left foot than the right foot. Reports it was severe enough for the patient to reach out to her primary care provider. (PCP) to start Gabapentin for neuropathic pain. PCP ordered labs to rule out infection and other causes for neuropathy which all came back negative. Patient has no known underlying risk factors that would predispose her to neuropathy. Neurologist did an EMG which showed no evidence of neuropathy. The patient went into to the office, and she had a skin biopsy to rule out small fiber neuropathy. She does not have results to provide for the skin biopsy at this time, however, the neurologist feels if the skin biopsy is positive, there may be an association with the vaccine in regards to the burning pain the patient is experiencing. She is calling to ask if this is a reported side effect. Treatment was confirmed as gabapentin was prescribed by PCP, and the patient started on it a few days after the onset of the burning pain. Outcome was noted as it has not improved, and has not resolved. No COVID tested post vaccination was noted. The outcome of the events was not recovered; the condition was persisting. Causality for the events was noted as related.; Sender''s Comments: Based on a compatible temporal association contributory role of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) to the onset of events pruritus, burning sensation, condition aggravated cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

CDC Split Type:
Write-up: During vaccine delivery, the seal between the needle and the syringe failed causing the vaccine fluid to ?squirt out? from the base of syringe all over the patient and the pharmacist who was administering the vaccine resulting in an unknown amount of vaccine?or possibly none at all? being delivered to the patient. Uncertain what to do, the pharmacist called Moderna and was instructed to start over and administer a ?half dose? of instead of a full dose of to the patient, which was completed with no further problems. However, the administration of only the ?half dose? was NOT noted on the patient?s vaccine card at the time, although this seems like very important information.

Other Medications: Flovent, Proair, Ritalin
Current Illness: None
Preexisting Conditions: Asthma, ADD, High Blood Pressure
Allergies: Amoxicillin, Penecillan, Azithromycin, Keflex.
Diagnostic Lab Data: None
CDC Split Type:
Write-up: About 12 hours after the 2nd dose was given, I woke up at 2:30am with a severe headache, uncontrollable chills, muscular discomfort, soreness at the injection site, and fatigue. I took 2 Tylenol, the chills subsided about 15 minutes after they began, and the headache was better about 30 minutes after taking the Tylenol. I was in and out of sleep on the couch until around 6am, and I took my temperature at that time. It was 102 degrees. I took a couple more Tylenol at 7am and contained to take 2 every 4 hours (last dose around 6pm that night). My temperature reduced gradually, but it was still over 101 degrees around noon. By 6-7pm my fever was gone and didn''t return. I called out of work sick, and I fell back asleep in bed from 8am-11:30am. I woke up with significant muscle pain in my left theigh (I sleep on my left side, but the pain was much more pronounced than usual). This lasted 3-4 hours. Overall, less acute muscle

soreness lasted the full length of pronounced reactivity (~2:30am to ~6:30pm on 02/09). Fatigue was evident until a went to bed around 11:30pm and not noted when I woke up at 6:30am on 02/10 for work. Soreness at the injection site (left arm) gradually decreased over about 3 days following the injection, but it never impaired my ability to engage in everyday tasks.

Previous Vaccinations:
Other Medications: CRESTOR
Current Illness:
Preexisting Conditions: Medical History/Concurrent Conditions: Heartbeats irregular

Allergies:
Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210
Write-up: arrhythmias; rapid heartbeat; slight nausea; slight headache; light bothered vision for some days; mild chills; A spontaneous report was received from a retired nurse concerning herself who is 90 year old received Moderna COVID-19 vaccine and have experienced arrhythmias, rapid heartbeat, slight nausea, slight headache, some visual problems (light bothered her for some days) and mild chills. The patient has prior history of irregular heart beat . Her relevant concomitant medications were cholesterol medication, Crestor and medication for irregular heartbeat. No information on allergies. On 28-JAN-2021, prior to the onset of events, the patient received her first of two planned doses of COVID-19 vaccine intramuscularly for the prophylaxis of COVID-19 infection. On 30-JAN-2021, 2 days after her vaccination, she developed arrhythmias, rapid heartbeat, slight nausea, slight headache, some visual problems (light bothered her for some days) and mild chills. After one week she felt like no more symptoms ongoing and felt good again. She visited her physician for arrhythmias, and he said, she should keep an eye on it, but no medication yet. She is concerned about her second shot. Action taken with 2nd dose of Moderna COVID-19 vaccine was not reported. The outcome of the events, arrhythmias, rapid heartbeat, slight nausea, slight headache, visual problems and chills were resolved at the time of report.; Reporter''s Comments: Based on the current available information and temporal association between the use of the product and the onset date of the events, a causal relationship cannot be excluded. However, patient''s advanced age and prior history of irregular heart beat are considered risk factors for arrhythmias.

Write-up: I was about 9 weeks pregnant with no complications at the time of my second vaccination. Estimated due date was 08/24/2021. I began bleeding and cramping and having headaches approximately 10 days after my second dose. I sought medical attention and was told that my baby no longer had a heart beat and that growth (based on ultrasound) had stopped around the 9 week mark. I had medical assistance to physically miscarry the deceased fetus. I have one healthy living son (2 years, 4 months old) who was delivered without complications naturally.

Allergies:
Diagnostic Lab Data: Test Date: 202102; Test Name: Blood test; Result Unstructured Data: Test Result:Unknown result; Comments: Blood test was performed to check vitamin D level, B12 level and thyroid (unknown result).; Test Date: 202102; Test Name: Heart rhythm; Result Unstructured Data: Test Result:heart went out of rhythm; Comments: Patient"s heart went out of rhythm and began to beat very rapidly
CDC Split Type: USPFIZER INC2021204491
Write-up: Patient"s heart went out of rhythm and began to beat very rapidly; This is a spontaneous report from a contactable consumer (patient). A 78-year-old female patient (weight: 71.21 kg, height: 168 cm) received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot. EN6201) on the left arm, at single dose, on 17Feb2021, for COVID-19 immunisation. Relevant medical history included thyroid disorder and acid reflux (oesophageal), both from an unspecified date. Concomitant medication included levothyroxine, from an unspecified date, at an unknown dose, for thyroid disorder. On an unspecified date, in Feb2021, the patient"s heart went out of rhythm and began to beat very rapidly. No treatment received. Blood test was performed on an unspecified date, in Feb2021 to check vitamin D level, B12 level and thyroid (unknown result). Post the vaccination, the patient has not been tested for COVID-19. Clinical outcome of the adverse event was unknown at time of this report.

Write-up: One week after I started a rash that was itch. The following morning I started getting small itchy blisters on my ankle and wrist. I would get a new batch of blisters everyday. They weren''t going away so I went to see a Dr. to see if it was from the vaccine. She said it looked like

a allergic reaction but I have not done anything different. So I got a prescription cream and it helped, about three weeks later they stopped occurring. I got my second dose but not no allergic reaction.

Previous Vaccinations:
Other Medications: Felodipine 5mg, HCTZ 12.5 mg, ASA 81 mg, Advair Inhaler once per day 250/50
Current Illness: 0
Preexisting Conditions: asthma, sinusitis
Allergies: 0
Diagnostic Lab Data: none
CDC Split Type:
Write-up: First 2-3 days felt normal discomfort at injection sit. It got progressively worse and began to feel like a torn rotator cuff. A lot of pain (7-8) unable to sleep on that side and unable to lift more than two pounds or drive or reach above my shoulder without pain of about a 10 on scale of 1-10. Saw orthapedic physician assistant on 03/26 who gave me a steroid shot in that shoulder with 75% relief by the next day. Still some minor residual discomfort at this writing. Also ran a fever with nausea and headache exactly two weeks after first shot.

Diagnostic Lab Data: Test Date: 20210224; Test Name: Chest X-ray; Result Unstructured Data: Test Result:mild pneumonia; Test Date: 20210219; Test Name: Nasal Swab; Test Result: Positive
CDC Split Type: USPFIZER INC2021214171
Write-up: reveled mild pneumonia; I tested positive for Covid19 19Feb (3 weeks +2days) after 2nd dose of vaccine; I tested positive for Covid19 19Feb (3 weeks +2days) after 2nd dose of vaccine; This is a spontaneous report from a contactable consumer (patient). A 70-year-old female

patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL9262; expiry date: unknown) via an unspecified route of administration in the left arm, on 28Jan2021 at 15:00, at a single dose, for COVID-19 immunisation. Medical history included known allergies to penicillins. Concomitant medication included acyclovir (ACICLOVIR). The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL1284) in the left arm, on 06Jan2021 at 13:00, for COVID-19 immunization. The patient is not pregnant at the time of vaccination. The patient was not diagnosed with COVID-19 prior vaccination. The patient did not receive other vaccines within four weeks prior to COVID-19 vaccination. The patient had dry cough and difficulty getting deep satisfying breath about 12Feb2021 (2 weeks + 2 days) after 2nd dose of Pfizer vaccine. The patient tested positive for COVID-19 nasal swab on 19Feb2021 (3 weeks +2days) after 2nd dose of vaccine. On 24Feb2021, patient was seen in a physician office for symptoms of cough and shortness of breath (SOB). On the same day (24Feb2021), chest X-ray revealed mild pneumonia. Patient was now on prednisone, azithromycin and albuterol inhaler. Patient was a little better and was now on 3rd day of taking 3 medications. Outcome of the events was recovering.

Other Medications: Amlodipine 5 mgs po qd
Current Illness: None
Preexisting Conditions: HTN
Allergies: NKDA
Diagnostic Lab Data: C-diff SAL/SHIG?CAMPY culture SHIGA TOXIN, EIA w/RFL to Ecoli culture Lactoferrin Calprotectin Hemoglobin
CDC Split Type:
Write-up: 1 week after my 2nd vaccine shot I began to have bloody mucous stools. I have NO

history of IBS or Chrons or previous bleeding. I monitored x 1 week and then reported it to my Dr. tests were ordered, all test for infection were negative. The two tests for inflammation (lactoferrin and calprotectin) were positive (the calprotectin which was done last as it is most sensitive to inflammation vs infection was abnormally high @ 264) At this time I am still having these bloody mucous stools and awaiting a colonoscopy. I reported this suspicion of it being an adverse reaction to the VT dept of Health, who encouraged me to call the VAERS line. I have left 2 messages.

CDC Split Type:
Write-up: Approximately 18 to 20 hours after my injection, my left arm developed a red and swollen rash in a circular shape approximately 3.5 cm in diameter. The circular area was very

sensitive and painful. My upper arm was also sore, although not severely. On day 3 or 4 post-injection, the red circular area remained the same in size but seemed less swollen. Although sensitive, it was no longer painful. However, it is now day 8 post-injection and the circle remains the same size and color.

Other Medications: Montelukast,Lisinopril, Tamsulosin, Sulindac, Benadryl
Current Illness: None
Preexisting Conditions: Asthma, Allergies, Hypertension, Polyneuropathy, BPH, OA. Has allergy injections each month. Last done on 2/23/21.
Allergies: Trees, Grass, Molds, Fungi
Diagnostic Lab Data: None
CDC Split Type:
Write-up: Patient woke up at 10:00PM, out of a sound sleep, having an acute asthma attack and generalized itching. No rash. Used Albuterol inhaler twice, 5 minutes apart, and took Prednisone 20 mg orally. Within 60-90 minutes, symptoms completely resolved and did not reoccur. He did not seek medical attention at the time of this reaction, but called this office on 3/11/2021 so that the reaction could be documented. That prompted today''s office visit and the completion of this VAERS form. Patient does have monthly allergy injections, but last injection was on 2/23/2021.

Diagnostic Lab Data:

CDC Split Type:
Write-up: Janssen COVID-19 Vaccine EUA- nausea first at 4:45am, followed upon rising by severe joint pain and an extreme migraine. It felt like my bones were made out of glass and someone had taken a hammer to my bones. My face was swollen and red. Unable to sit up. Walk from bed to toilet only. Overall, I would say extreme flu-like symptoms. Temperature 99.6 all day. I could not take the pain any further at 4:20 pm and took 1,000 mg of Tylenol. I finally fell asleep and woke up at 8:30pm and could walk again and my fever had broken. I still don''t feel great, but I think the worst is behind me.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Moderna COVID 19 Vaccine EUA I felt malaise and pain at site of injection within six hours of receiving the second dose of the Moderna vaccine. I was asleep by 9PM and woke around 11 PM with intense nausea. I proceed to vomit violently throughout the night, at least fifteen times. I believe this was intractable nausea and vomiting. I vomited through the next morning and finally stopped by mid afternoon of the next day. I did not go to the emergency room or call my doctor because I am very healthy overall, because as an acupuncturist I am trained in health and I was able to keep myself from getting dehydrated, and because due to living for many years in developing countries. I have some experience with acute bouts of intense illness and felt able to monitor myself.

Other Medications: Taken daily, including morning of vaccine: 25 mg Losartan Potassium, 100 mg vit C with Citrus bioflavinoids, 50 mg CoQ10, 2 tablets of Bio-B complex, Vit D Emulsion Forte (d as cholecalciferol, sesame seed oil, gum arabic), 100 calcium/m
Current Illness: none

Preexisting Conditions: arthritic right hip being treated with orthovisc injections (series of 3 a week apart every 6 months
Allergies: Aspirin, mold, pet dander
Diagnostic Lab Data: n/a
CDC Split Type: KB/VDH
Write-up: At 3 PM (6 hours after injection) my right hip became incredibly painful (12 on a scale of 1-10) and my right leg was not able to bear weight (it would "give" when attempting to walk). During the night, it felt like my hip was "on fire". 1000 mg of Tylenol Rapid Release helped. The pain was greatly diminished and my leg was able to bear weight by by 8 AM on the following day.

Previous Vaccinations: First flu shot - swelling, hot to touch, painful for a week
Other Medications: Simvastatin 20mg, Levothryoxine Sodium 50mcg
Current Illness: None
Preexisting Conditions: Hashimoto disease (diagnosed 2018)
Allergies: Hay fever, local reaction to bee stings, dislike eggs and milk (possible allergy?)
Diagnostic Lab Data: None. CDC website says not to worry, it will go away.
CDC Split Type:
Write-up: On the 9th day after vaccination my arm began itching. The next morning (10th day) I noticed a red rash beneath the injection site, and the rash area was hot to the touch and swollen. I''m at day 14, the rash isn''t as bright red but it''s larger (larger than my palm), still swollen, and still hot to the touch. I''m reporting this because the CDC website says only 14 people have reported having this.

Other Medications: Eliquis, tadalafil, lansoprazol, diltiazem, cetirizine,
Current Illness: No
Preexisting Conditions: Asthma, atrial fibrillation. (I had an ablation in the fall, that seemed to have worked.)
Allergies: No
Diagnostic Lab Data: Just the pulse oximeter
CDC Split Type:
Write-up: No treatment. I had a cardiac ablation in the fall because of chronic atrial fibrillation. It appeared to have worked. One day after receiving the vaccination I took a walk with some hills and had what I believe was a mild episode of atrial fibrillation. I verified as best I could, using a pulse oximeter. I feel fine for the most part, but a little bit tired and dizzy. I do not plan to call the doctor unless things get worse.

CDC Split Type:
Write-up: Upon leaving the vaccination site, I began experiencing "twitching" or mouth spasms on the left side of my face. The exact area was between the corner of the mouth and the cheek area/bone. They were persistent for the remainder of the day on 3/16/21. The twitches/spasms were similar to an eye twitch and lasted into the day on 3/17/21. The twitching subsided today, 3/18/21 but still experiencing them off and on, just not consistent or as frequent.

CDC Split Type:
Write-up: I received my 1st dose on 2/26, but I still have intermittent level 2-3 pain in the left upper arm where I was given the shot. I think eventually it will go away, but since my 2nd shot is coming up and it has been almost a month, I thought I should mention it to you and ask whether I should mention it to the CDC as a reaction. I think this is just a result of the injection itself and not of the vaccine. But I have never had such a lingering pain before from an injection and so I raise the question.

Allergies:
Diagnostic Lab Data:
CDC Split Type: US0095075132103USA004197
Write-up: Genital warts; The patient was administered Pneumovax in February 2005 and October 2005; This spontaneous report has been received from other healthcare professional via a medical records from a case in litigation for zoster vaccine live (ZOSTAVAX)(2102USA003524), concerning a 52-year-old female patient (pt). The pt was a smoker. She was allergic to codeine, cephalexin and sulfa drugs. Her concurrent conditions included transverse sinus thrombosis, hypercoagulation with anticoagulant therapy, depression, astroesophageal reflux (GE) disease, lumbar spinal stenosis (LLS), obesity, hirsutism, allergic rhinitis, pernicious anaemia, iron deficiency anemia- malabsorption. The pt"s family history included coronary artery disease (CAD) and cystic fibrosis. The PT" medical history included pain in left elbow, gastric bypass, anxiety,

peptic ulcer disease (PUD), peripheral edema, furuncle, chronic low blood pressure, left lower extremity (LLE) radiculopathy, cholelithiasis, jaundice and rotator cuff strain. The patient received doses of unspecified influenza vaccines on unspecified dates in: November 1992; September 1993; October 1994; November 1995; November 1996; October 1999; November 2000; November 2001; October 2002; September 2003. It was also reported that the pt was vaccinated in the past with tetanus (+) diphtheria (+) pertussis (Tdap) vaccine (on 01-AUG-2003). On an unknown date in February 2005, the pt was vaccinated with first dose of pneumococcal vaccine, polyvalent (23-valent) (PNEUMOVAX). On an unknown date in October 2005, the pt was vaccinated with the second dose of pneumococcal vaccine, polyvalent (23-valent) (PNEUMOVAX) for prophylaxis (dose, route of administration, anatomical location, lot# and expiration date were not provided for both)(inappropriate schedule of vaccine administration). On an unknown date in November 2005, the pt experienced genital warts. The outcome of the event of genital warts was not reported. The causality assessment between the event of genital warts and pneumococcal vaccine, polyvalent (23-valent) (PNEUMOVAX) was not provided. All available medical records will be provided upon request. This is the one of two cases regarding the same patient (linked: MARRS#2102USA008735).; Sender''s Comments: US-009507513-2102USA003524:

Previous Vaccinations:
Other Medications: Aspirin Calcium and vitamin D3 Citrucel

Current Illness: None
Preexisting Conditions: Celiac Disease Hemochromatosis
Allergies: Keflex Seasonal allergies - hay fever
Diagnostic Lab Data: Heart monitoring over a period of two weeks Heart ultrasound
CDC Split Type:
Write-up: I started to feel unwell soon after receiving the vaccination. I was tired and had a sore arm the first day. By the second day, I began having heart arrhythmia and shortness of breath, which was confirmed at my physician''s office by EKG. I was referred to a cardiologist. Today (day three), I am still feeling less energetic and have a higher than usual amount of skipped beats. I get short of breath easily. This afternoon I have a bad headache. My cardiologist has ordered heart ultrasound and monitoring out of an abundance of caution. He says it could be that the inflammation from the vaccine might be causing heart irritation.

Diagnostic Lab Data:
CDC Split Type: USMODERNATX, INC.MOD20210

Write-up: Hematoma Cellulitis; Hematoma Cellulitis; A spontaneous report was received from a nurse professional (patient) concerning a 66-years-old female patient was who received Moderna"s COVID-19 Vaccine (mRNA-1273) and had hematoma cellulitis (cellulitis) and hematoma cellulitis (haematoma). No medical history was reported. The concomitant medications included metoprolol, colecalciferol, atorvastatin, ibuprofen. On 28 Feb 2021, the patient received their first of the two planned doses of mRNA-1273 (Batch number: 025A21A) intramuscularly in left deltoid for the prophylaxis of COVID-19 infection. On 28 Feb 2021, the patient developed hematoma cellulitis (medically significant). No treatment information was provided. Action taken with mRNA-1273 in response to the events was unknown. The outcome of the events of hematoma cellulitis (cellulitis) and hematoma cellulitis (haematoma) was unknown. The reporter did not provide assessment for the event of hematoma cellulitis (cellulitis) and hematoma cellulitis (haematoma).; Reporter"s Comments: Based on the current available information and temporal association between the use of the product and the start date of the events, a causal relationship cannot be excluded. Further information has been requested.
