Diagnostic Lab Data: MRI scan of right brain-nml
CDC Split Type: U1999010150
Write-up: It was reported that a 56 year old male pt received a Fluzone UNSP "99-"00 vaccination on 10/14/99. Reportedly, on 10/31/99, the pt developed paresthesia from sole of left foot with gradual increase to left leg, left side of body and left arm to the forearm. The paresthesia has faded in the same pattern it progressed. No right side involvement, pt"s reflexes were normal. Pt also developed paresthesia below right ankle at this time and is fading. The doctor has not confirmed dx with spinal tap or nerve conduction studies due to symptoms resolving at this time. No additional information was provided from correspondence returned on 12/17/99.

Allergies:
Diagnostic Lab Data: serum varicella zoster - nonimmune
CDC Split Type: WAES00071611
Write-up: Information has been received from a RN concerning a patient that tested nonimmune to varicella and who on 06/28/2000 was vaccinated with varicella virus vaccine live. On 07/16/2000 the patient experienced a chickenpox like rash. The patient is very concerned about this in that at least one other family member, a brother received the vaccine and developed chickenpox and quickly thereafter shingles. The patient stated that he does not have any known immunodeficiency and is very worried since he works with the public. The patient sought unspecified medical attention. Additional information has bee requested.

Other Medications: Carnitine
Current Illness: NONE
Preexisting Conditions: Carnitine decreased; developmental coordination disorder
Allergies:
Diagnostic Lab Data: Blood culture positive Streptoccus pneumoniae; "many and early" body temperature increased 105 (deg.F)
CDC Split Type: HQ8919628NOV2001
Write-up: A physician reported that a 10-month old female received 3 injections of Prevnar (dates not specified). The patient''s medical history included macrocephaly, "mild" gross motor delay and low carnitine levels. Concomitant therapy included carnitine. The patient experienced pneumococcal bacteremia and was said to be " very sick with fevers to 105 without a source". A blood culture revealed " many and early" Streptococcus pneumoniae. A repeat blood culture prior to initiation of antibiotic therapy was negative. The patient also experienced otitis. she was treated with 10 days of amoxicillin therapy and the events resolved. The events were considered to be "medically important" Follow-up info received on 01/02/2002 clarified the pt''s age to be 9 months and the lot number of the vaccine.

Previous Vaccinations:
Other Medications: UNK
Current Illness: UNK
Preexisting Conditions: UNK
Allergies:
Diagnostic Lab Data: UNK
CDC Split Type: HQ3988102AUG2001
Write-up: A physician reported that an 18-month old female received her second dose of Prevnar on 06/13/2001. On 06/19/2001, she was seen by her pediatrician for a chronic cough. Physical exam revealed rales on her left side, but otherwise, the child was in no acute distress. She was diagnosed with pneumonia and treated with Zithromax. The physician noted that if condition continued, a diagnosis of asthma may be considered. On 07/05/2001, she was again seen by the physician for an irritability cough, shortness of breath, wheezing, not sleeping well and some retractions. The child was in mild to moderate respiratory distress. Her exam was consistent with reactive airway distress. She received Albuterol via nebulizer and responded well. There was a decrease in her respiratory rate and an increase in breath sounds. On 07/12/2001, the child was seen for a recheck. Physical exam was within normal limits and her lungs were entirely clear. The physician indicated that "her original pneumonia most likely was an episode of asthma". She was placed on Flovent 44 mcg BID and Albuterol PRN. The physician noted "It is my opinion that this is not a vaccine related reaction".

Current Illness:
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type: U200200682
Write-up: From e-mail correspondence received at manufacturer on 8/20/02, was reported by the pt''s husband, a MD, that his 53 year old wife received Imogam and Imovax vaccines after exposure to bats on 8/10/02. Pt received 1300 IU of Imogam divided in four IM injections in the buttocks and one cc of Imovax in the left deltoid muscle without reactions. About 15 minutes after receiving the second one cc dose of Imovax IM on 8/14/02, pt developed tightness in the chest, fuzzy feeling in the head, phlegm in throat, slight itch on scalp and nose, and tachycardia. Later her pulse was slow ~60 and not very strong, no treatment given and within one hour later all symptoms had disappeared. "In the view of the allergists, she had an anaphylactic reaction, albeit mild." He suggests that pt should get her blood drawn for rabies antibody titer and repeat it in two or three weeks. IF antibodies are rising, then probably stop the series. If the titer is low or not rising, then perform skin test on pt with the vaccine and desensitize, if necessary, so she could received the three remaining doses, perhaps divided, following antibody titers.

Previous Vaccinations:
Other Medications:
Current Illness: None, and to my knowledge I have never been bitten by any tick.
Preexisting Conditions: None
Allergies:
Diagnostic Lab Data: I do not have the records of exact dates that the clinic administered the vacine. The pains and tiredness crept up on me. I srt of ignored them at first but they were to noticeable by May of 200 too ignore.
CDC Split Type:
Write-up: At the time I was a member of a Health plan. I left the health plan in 2001 and had Lyme desease vacinine administered by the Health Plan in the two prior years (3 shots a month apart in first year a booster in the following year). By May of 2002 a series of misc aches and pains would come and go and I would get sudden extreme attacks of tiredness, and a deteriation in my balance. It took months to convince my new Doctor to test me for Lyme desease (positive) and he only reluctantly agreed to treat me after I requested a second opinion. I have been taking DOXYCYCLINE for 3 weeks. The pills resulted in a sudden lessening of the symptoms which has been followed by a slower improvement. At present pains are mostly restricted to joints (hands,

knees and hips). I still get tired to a unusual amount compared to my pre innoculation life. Dr says she is unaware of the proper treatment program for people who have had the vacine and now test positive for Lyme desease and exhibit the sypmtoms of Lyme desease. Currently she has said to take the DOXYCYCLINE pills twice a day for a period of 60 days. Up to this catastrophy I have been extremely healthy all my life. I am worried that the treatment may be stopped to soon and that I now may have permanent damage to my system. The 60 day follow up states extreme tiredness and random pains have disappeared. All joint ache which they did not do before. In particularly fingers, hips and elbow. Took two motnhs of Doxycycline starting 9/6/02 (100mg tablets twice a day).

Write-up: Information has been received from a Registered Nurse who was the mother of a male pt who in 1999 was vaccinated with a dose of MMR II, (lot number not reported). In 1999, ten days post-vaccination the pt developed a "measles rash." Medical attention was sought. Subsequently, the pt developed "tracheitis" which required hospitalization. The pt was sent to ICU to be placed on a ventilator. At the time of the report, the pt was four years old. Additional info has been requested. Follow up info received on 1/28/03 from the physician revealed that the pt had not been to their clinic since 12/15/99 and MMR II was not given there. No additional info is expected.

Write-up: In 1999 (specific date not provided), the vaccinee received her 2nd injection of Engerix-B (lot ENG3090A6). On 11/17/99, post vax, she experienced generalized hives. She was seen by a physician and the event resolved with unspecified sequelae on approx. 11/23/99. The Engerix-B immunization series was discontinued. The reporter indicated the event was probably related to the thimerosal in vaccine.

Diagnostic Lab Data: 2/17/03 : CPK of 29, 826 (nl 0-160), normal electrolytes and normal BUN and Creat.
CDC Split Type:
Write-up: 43 year old female physician who had onset of intense pain and weakness in her bilateral quadriceps after two hours of moderately strenuous cross country skiing on 2/16/03. She had not been hydrating herself during the skiing. The evening of 2/16/03 she noted continued thigh discomfort and also darkened urine which she dipsticked and found 3+ positive heme. She increased her oral fluids and came into the medical center on 2/17/03 for labwork and was found to have a CPK of 29, 826 (nl 0-160), normal electrolytes and normal BUN and Creat. She discussed with nephrologist who advised to continue oral hydration as treatment for rhabdomyolysis given normal renal function. She continued to have pain in her thighs and weakness with limited standing and walking tolerancee. She was seen by her Primary care physician on 2/19/03 and was noted to have slt edema to the left calf and thigh and doppler ultrasound was done to r/o DVT. This was negative. Repeat labs showed reduction of CPK to 15, 000, normal CBC, and continued normal renal function. A urinalysis was normal. No other physical findings aside from tenderness to palpation of the bilateral quads. No skin changes, bruising or rash. PMH: unremarkable. She is an active individual that in the past has had no problem tolerating bursts of increased physical activity. She had participated in a one hour spinning class the day before the skiing and was sore after that. She had not been doing spinning on a regular basis. She had the smallpox vaccination on 2/3/2003 and had a documented "take". She had experienced some itching at the site but no other significant side effects. She denied any constitutional symptoms during the days preceding or the days of her physical activities. She had children that had been ill with a flu like illness the week prior to these symptoms but she had not had any symptoms. She had received the influenza vaccine last Fall. Her current status as off today (2/24/03)is that her thigh pain and weakness is slowly improving. She has a new CPK test pending.

Write-up: This Report describes swelling in a 19 y.o. male who received Havrix vax. The PT had no allergies and did not know if he had had any other reactions to previous vax"s. Concurrent medications were not specified. On 3/8/02, the vaccinee received his first injection of Havrix. That evening at about 21:00, both hands and eyelids began to swell. The swelling went away by the next morning, but returned to a lesser extent the next evening. No medical attention was required. The reporting nurse states that "they really don"t think it is necessarily related to the Havrix; could be anything." As of 3/20/02, the swelling resolved.

CDC Split Type:
Write-up: At 2 months of age, 8/27/97, HIB #1, Hep B #1, IVP #2, DTaP #1; 10/22/97 HIB #2, Hep B #2, IPV #2, DTaP #2. Reacted to immunization with fever then several hours later convulsions. Seizures not present prior. No improvement over several weeks. Took child to hospital and doctor gave 10/27/97 shots; I said no. She did them anyway. Child died a few months later. 8/12/03: Information received from corrections facility where the reporter is an inmate, indicates that he may not receive outside phone calls but letters are permitted. A letter of request for ER and inpatient record was faxed for the admission on 11/22/03. 8/14/03 This record was received and includes: the ER evaluation; the H&P and the Discharge Summary w/ an addendum that includes the findings from the transfer hospital where child was hospitalized for more extensive evaluation of abnormal head CT. The discharge diagnosis on 11/25/97 was Failure To Thrive. The addendum

which was added after the child"s transfer and evaluation at the higher level of care facility was a diagnosis of Krabbe Disease, an autosomal recessive genetic disorder leading to progressive demyelination of the nervous system. As a result of this evaluation, it was also determined that the mother"s father was also the child"s father and this man was later arrested and arraigned on sexual assault charges. There was no autopsy done on this patient per Office of Chief Medical Examiner. 8/13/03 Call to PMD for this child from birth to the time of his death, to request immunization and relevant OV records. Since it has been 5 yrs since the death of this patient, they have placed the records in storage. She has agreed to locate the records and send them to VAERS 9/3/03 Official Certificate of Death received which confirms the cause of death as Krabbe"s Disease. A copy of the 5 pp. Discharge Summary from hospital is received for the admission from 11/25/97-12/02/97. The discharge diagnosis is listed as progressive leukodystrophy, probable Krabbe Disease. It is not clear if or when the immunization records with lot#s will be received. That information will be added when available. Follow-up is otherwise complete.

CDC Split Type:
Write-up: MMR #1 and Varicella #1 vaccines given 08/01/2003; 7 days later developed fever to 103.5, intermittently for 3 days which may have been associated with an otitis media. About 2 weeks after vaccines, vaccine site developed progressive welt which appeared pruritic, had some serosanguinons drainage and crusted. About 16 days after vaccines developed diffuse, predominantly maculopapular non-pruritic rash on trunk, arms, face with a few vessicles and crusted lesions.

Diagnostic Lab Data: UNK
CDC Split Type: A0392993A
Write-up: A physician''s assistant reported the occurrence of pain at the injection site in a 29 year old female who was vaccinated with hepatitis B vaccine recombinant (Engerix-B) for prophylaxis. The subject''s medical history included "mild", persistent, left arm pain following receipt of her second injection of hepatitis B vaccine (Recombivax-HB, Merck) in October 2001. The pain was exacerbated by palpation and "specified movement of the arm". Concurrent conditions and concurrent medications were unknown. In May 2002, the subject received an injection of Engerix-B (Lot # ENG5216A2) administered into the left arm. Subsequently, the subject experienced increased pain at the injection site. The subject was seen in the clinic. The pain was not located in the shoulder joint and the subject had full range of motion. However, she reported difficulty reaching into the back seat of her car. The pain persisted as of 04/14/2003. The reporter considered the injection site pain to be possibly related to "scar tissue from injection".

Write-up: Information has been received from a RN concerning a 49 year old obese female with dyslipidemia who on approximately 3/9/03, "a little over a month ago," was vaccinated with a dose of hep B vaccine. There was no concomitant medication. On approximately 3/14/03, in the weeks after the vaccination, the pt developed a fever, joint aches (especially in her shoulders and knees), pimples on her face, and a numb forehead. Unspecified medical attention was sought. Additional info has been requested.

Write-up: INJECTION SITE PAIN; MOBILITY DECREASED. This report was received from GlaxoSmithKline for hepatitis B vaccine recombinant (ENGERIX-B) and was assigned manufacturer report number A0392993A. This was originally report by a physician''s assistant concerning a 29-year old female who in October 2001, was vaccinated with the second dose of hepatitis b virus vaccine rHBsAg (yeast). Subsequently the patient experienced "mild", persistent, left arm pain. The pain was exacerbated by palpation and "specific movement of the arm." Concurrent conditions and current medications were unknown. In May 2002, the patient received the third dose of hepatitis b vaccine recombinant (ENGERIX-B) (lot #ENG5216A2) administered into the left deltoid. Subsequently, the patient experienced increased pain at the injection site. The patient was seen in the clinic. The pain was not located in the shoulder joint and the subject had full range of motion. However, the patient reported difficulty reaching into the back seat of her car. The pain persisted as of 14APR2003. The reporter considered the injection site pain to be possibly related to "scar tissue from injection". No further information is expected.

Write-up: On 22 MAY 04, headache, fatigue, and generalized aches and pains started 2 days after vaccination. On 26 MAY 04, pt developed joint aches, fatigue, and fever. Fever peaked at 103 degrees on 28 MAY 04 at same time as developed erythematous papules, which eventually coalesced into large papules around injection sites on both arms. Shots #1 and #3 on L deltoid, shot #2 on R deltoid. Pt reported on 1 JUN 04 that symptoms were decreasing but not resolved. Pt was taking Tylenol 3000-4000mg/day at that time. Exam of injection sites on 1 JUN 04 showed R deltoid having very few, small erythematous papules within 3 cm of site and small, firm nodule at site, and no increased warmth. L deltoid had few small erythematous papules within 4-5 cm of sites and approx. 4 cm nodule at sites, with increased warmth, and very slight erythema. Pt saw PMD on 27 & 29 MAY 04. Rash went away 31 MAY 04, fever gone 1 JUN 04.

CDC Split Type: WAES0310**USA**03333
Write-up: Information has been received from a licensed PRN concerning a female who in October, 2003, "couple of weeks ago" was vaccinated in the he arm with a dose of pneumococcal

23v polysaccharide and was evaluated at the office for a red, swollen and painful arm. Unspecified medical attention was sought. Subsequently, the symptoms resolved and the pt recovered. There was no product quality complaint involved. Follow up info received from an LPN indicated that the outcome is recovered. The reporter expressed concern about the particular lot of vaccine and requested a lot check on 1026M. The records of testing prior to release of this lot have been checked by QA and found to be satisfactory. The lot complies with the standards of the Center for Biologics Evaluation and Research and was released. The reporter also mentioned that three other pts were vaccinated with a dose of pneumococcal 23v polysaccharide vaccine and experienced a similar rxn. Additional information is expected.

Other Medications:
Current Illness:
Preexisting Conditions: The patient had no illnesses at the time of vaccination. The patient had no pre-existing diagnosed allergies, birth defects or medical conditions. From additional information received on 22Sep04, it was reported that the pt had his last rabies vaccine in 1999 with no prior reactions reported. He was on no concomitant medication at the time of vaccination on 31Mar04.
Allergies:
Diagnostic Lab Data:
CDC Split Type: 200402626
Write-up: From initial information received on 8/6/04 from a health care professional regarding an adverse event occurring in the USA, it was reported that a 35 year old male patient received a RABIES vaccine, administered at 8:30am on 3/31/04. The lot number, route, site, and dose number information was not provided for the product administered. Sometime after the administration of the Rabies product the patient experienced a pre-syncope episode, chest pain, and a ventricular ectopy. The patient''s recovery status was reported as recovered. Follow up on 09/28/04 states: "From additional information received through a telephone call on 09/22/04 from a physician, it was reported that the pt received IMOVAX RABIES on 03/31/04. The physician did not have the lot #, but stated that she would call back with this information, as well as the route of administration. The pt received the vaccine as part of a post-exposure series. He is a veterinarian, who was exposed to bull saliva during intubation. The bull was a suspected carrier of rabies. The pt''s last rabies vaccination was in 1999 with no prior reactions reported. His diagnosis of ventricular arrhythmia was based on cardiac monitor rhythm strips, as well as by pt''s symptoms. He has since recovered from these events without sequelae." From additional information received on 29Sep04 from a healthcare professional, it was reported that the pt received the

Imovax Rabies vaccine from a recalled lot, lot number W14192 administered IM. Reportedly the pt has fully recovered from the event.

Allergies:
Diagnostic Lab Data: Bacterial and viral cultures, including HSV - negative. Vaccinia by PCR positive.
CDC Split Type:
Write-up: Secondary Transmission Nonvaccinee (No information known about the vaccinee, other than he had his SPV around 4/24/04. He is thought to be deployed.) Contact was an 18-y.o. student who slept with vaccinee several nights (not sure if vaccine site was bandaged/covered). On 5/3/04, she sought evaluation for a perineal fissure which appeared "a little oozy". Wet mount was negative. HSV was sent and later determined to be negative. On 5/4/04, she noted several vulvular papules, which were painful. By the time she was evaluated that day, she had about 7-8 white, firm, slightly tender papules on lower vulva. Evaluated by Derm, and even though HSV culture was negative, was treated with Valtrex for 10 days and aquaphor. On 5/5/04, because of discomfort and problems sleeping, was given Tylenol #3 and xylocaine jelly. By 5/10/04, lesions beginning to heal (outer lesions drying; mucus membrane lesions still painful and red); viral and bacterial cultures sent. On 5/12/04, Lesions drying, flat and dark pink.

Current Illness:
Preexisting Conditions: Herpes genitalis; Hypercholesterolemia; Vitiligo
Allergies:
Diagnostic Lab Data: UNK
CDC Split Type: WAES0408**USA**02185
Write-up: Information has been received from a physician concerning a 46 year old white male patient with no known allergies and vitiligo, and a history of herpes genitalis and hypercholesterolaemia, who on 10/9/03 and 12/5/03 was vaccinated SC in the arm with a first and second dose of varicella virus vaccine live (lot # 643597/0895M). It was noted that the patient was not ill at the time of vaccination. On 8/23/04 the patient developed herpes zoster, and medical attention was sought. The physician reported she performed a clinical diagnosis of herpes zoster but no specimen was taken. The physician reported that the patient''s rash was on the left side of frontal scalp that included the left eye, and headache. THe patient was treated with famcyclovir 500mg twice daily and acetaminophen (+) hydrocodone bitartrate and he was referred to an ophthamologist. The patient is recovering, but still experiencing opthalmic symptoms and headache. It was noted the physician requested information on the varicella zoster identification program. Follow up information has been received from the physician who reported that the patient was diagnosed with Ramsay-Hunt syndrome and his symptoms included left facial pain and blistering on the tip of his nose and anterior forehead. It was noted that the patient was seen by the ophthalmologist and he was found to be positive for left eye corneal ulceration. The patient recovered on an unspecified date. Ramsay-Hunt syndrome and left eye corneal ulceration were considered to be other important medical events (OMIC). No additional information is expected.

Diagnostic Lab Data: Unknown--contact hospital.
CDC Split Type:
Write-up: Patient received full dose of FluMist. She waited 15 minutes without incident and left the clinic area. Approximately 20 minutes after leaving the clinic area, she returned c/o generalized pruritus, particularly on chest, arms, palms of hands. Erythema and diffuse papules were present on her chest only, in the lower sternal area extending approximately to mid-clavicular area. Dorsal thorax, stomach area, extremities negative for rash. Patient denied all symptoms except pruritus. Lungs and VS serially assessed over a period of 1/2 hour remained within normal limits (lungs clear, VS WNL). 50mg PO benadryl was administered. Phone consultation with primary care physician resulted in patient being transported to Emergency Dept. where she was assessed and released that day. Rx was benadryl PRN and prednisone 20mg x 2D. Treated at hospital.

Life Threatening? No
Birth Defect? No
Died? No
Permanent Disability? No
Recovered? No
Office Visit? No
ER Visit? Yes
ER or Doctor Visit? No
Hospitalized? No
Previous Vaccinations:
Other Medications: ASA; Zocor
Current Illness:
Preexisting Conditions: Patient''s pre-existing medical conditions include high cholesterol. He has no known allergies. He had no illnesses at the time of vaccination. The patient previously received four doses of influenza vaccine with no reactions reported.
Allergies:
Diagnostic Lab Data: The patient had an MRI completed in October of 2004. MRI results were not provided. From additional information received on 1/14/05, a radiology report was provided. The patient had an MRI of his right shoulder on 10/22/04 due to shoulder pain. The MRI showed marked AC joint hypertrophy with some secondary bone edema, especially at the distal clavicle. Some focal lucency was also noted at the site. The changes might have been due to osteoarthritis, but an erosive arthropathy could not be completely excluded and correlation with the patient''s history and involvement of other joints was recommended. There was impingement on the superior aspect of the supraspinatus, but no rotator cuff tear was seen. Other focal bony abnormality was not noted. There were changes of chronic impingement on the posterior aspect of the superolateral humerus. The physician also thought it relevant to know if the patient has a history of prior dislocation as there was some bony irregularity at the posteroinferior aspect of the glenoid labrum also seen with slight abnormality in bone signal change on the gradient images. The physician''s impression was marked AC joint hypertrophy, labrum intact and minor glenoid changes as described.
CDC Split Type: 200403589
Write-up: From follow up information received on 1/14/05 the seriousness of this case was

upgraded from non-serious to serious, as based upon medical judgement. From initial information received on 11/1/04 from a registered nurse regarding an adverse event occurring in the USA, it was reported that a 51 year old male patient received a dose of FLUZONE vaccine, lot number U106888, administered in the right deltoid on 10/17/03. Four days later, on 10/21/04, the patient developed lingering shoulder pain at the right deltoid site. The patient has seen an orthopedic shoulder specialist and has been through physical therapy. He also used non-steroidal anti-inflammatories with no beneficial effect. The orthopedic shoulder specialist thought that the patient may have developed some sort of myositis. Patient''s pre-existing medical conditions include high cholesterol. He has no known allergies. He did not have any illnesses at the time of vaccination. Concomitant medications at the time of vaccination included ASA and Zocor. The patient previously received four doses of influenza vaccine with no reactions reported. Reportedly, the discomfort, although it has waxed and waned somewhat, has not diminished significantly over the last several months. The patient has not recovered from these events. From additional information received on 1/14/05, from a physician, it was reported that the patient received a 0.5ml dose of FLUZONE, administered IM in the right deltoid. Reportedly, the patient had no illnesses at the time of vaccination. An MRI of the patient''s right shoulder was completed on 10/22/04 due to right shoulder pain. The MRI showed marked AC joint hypertrophy, labrum intact and minor glenoid changes. Per the reporter, the patient''s shoulder pain was somewhat improved as of the patient''s office visit on 12/23/04. The physician stated that he does not consider the adverse events to be a significant or permanent disability, but it was a cause of significant pain. Reportedly, the patient retained strength, range of motion and function of his shoulder. Contact information for the patient''s orthopedic specialist was provided. The adverse event coding for injection site pain was upgraded to shoulder pain.

Write-up: Information has been received from a woman in a physician''s office concerning a 9 year old female with no medical history who on 27 MAY 1997 was vaccinated SC with first dose of Varicella. Concomitant vaccinations on that same day included an IM fourth dose of TRIPEDIA. There was no illness at teh time of vaccination. It was reported that on 10 JAN 2005 the patient''s mother called the physician''s office indicating that her daughter developed slightly itchy leasions on her chest, legs and back and subsequenlty developed more. As of Feb 2005 the patient was noted to be recovering as her lesions were in the process of scabbing. Subsequently the patient''s slightly itchy lesions resolved. Additional information is not expected.

CDC Split Type: A0528569A
Write-up: This case was reported by a health professional to a sales representative and described the occurrence of chest heaviness in a 51 year old male patient who received hepatitis A inactivated and hepatitis B recombinant vaccine (Twinrix). The patient''s medical history was notable for diabetes. The reporter also stated that the patient was afraid of needles. On 09/30/2004, the patient received the first dose of Twinrix. Approximately two hours following the first dose of Twinrix, on 09/30/2004, the patient experienced a heavy feeling in his chest. The patient was seen in an emergency room. The reporter stated that in the emergency room, they could not locate any cardiac problem and the patient was not admitted. The patient then was seen by his regular physician. The reporter stated that, the regular physician could not find any cardiac problems. The event was ongoing at the time of initial reporting.

Current Illness:
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Had his shots on September 6, 2005, both in the left arm. The next day he had swelling, rash, and bruise on at shot location, which got progressively worse and became significant over the next few days. He also developed a stuffy nose that made it difficult for him to sleep on Thursday night. The symptoms increased on Sunday night when his breathing became difficult, he was "hitching" and grunting with each breath. We took him to the emergency rooom on 9/11/05 and his oxygen was at 91%. He was given a nebulizer with oxygen at 10 and when we brought him home we gave him another treatment at midnight. He was doing much better the next day. On 9/14 (today) he still has bruising, redness and soreness at the shot site.

CDC Split Type:
Write-up: IN 1971 I WAS GIVEN SMALLPOX VACCINE. I BEGAN PASSING OUT AND GETTING SHORT OF BREATH WITH CHEST PAINS. THEY SENT ME TO A HOSPITAL. THE CARDIOGLIST RECOMMENDED DISCHARGE. ALL MY MEDICAL RECORDS HAVE DISAPPEARED AS THIS WAS A TEST VACCINE I HAVE SUFFERED THE SIDE AFFECTS ALL THE REST OF MY LIFE. I HAVE HEARD NEWS REPORTS ABOUT THIS SAME VACCINE WITH SAME SYMPTOMS AND DONT WANT MORE PEOPLE TO SUFFER LIKE ME. Per 60 follow up: I have fluid around my heart, I take 3 blood pressure medications 3 times a day, I have not had a day go by since I got this shot that I haven''t had some bad reactions from migraines to fluid in my chest and pain. The VA refuses to admit that I received this vaccine at anytime in the marine corps so I plan to get an attorney to sue to recover for my pain and suffering. 1/4/10 I still have migraine headaches and fibromiagama. I also have fluid around my heart and take over 6 blood pressure pills including fluid pills a day. I also take four pensation pain pills a day. I have these problems since the day I was give this vaccine.

CDC Split Type:
Write-up: Mom reported diarrhea x 8 days. 10/16/06 Received medical records from PCP office which reveal patient developed watery green diarrhea for approx 11 days, completely resolved by

9/29/06 but GERD remained. Treated w/zantac & formula change. Dx: probable immunization reaction to Rotateq, resolved./ss This is in follow-up to report(s) previously submitted on 10/10/2006. Information has been received from a physician concerning an 8-week-old male with no medical history who on 30-AUG-2006 was vaccinated PO with the first 2.0 mL dose of ROTATEQ (Lot #654352/0410F). Concomitant vaccinations administered on that same day included the first IM dose of PEDIARIX (Lot #AC21B056AA), the first IM dose of ACTHIB (Lot #UE785AA) and the first IM dose of PREVNAR (Lot #B08653B). There was no illness at the time of vaccination. The physician reported that on 31-AUG-2006, the patient developed diarrhea characterized by 2-5 episodes per day. On 07-SEP-2006, the patient required an office visit. At that time, the patient afebrile and no blood was noted in his stools. No laboratory/diagnostic tests were performed. As os 11-SEP-2006, the patient''s diarrhea persisted characterized by small volumous episodes occurring five times daily. Subsequently, the patient''s diarrhea resolved. Additional information is not expected.

Diagnostic Lab Data: UNK
CDC Split Type: A0595153A
Write-up: This case was reported by a nurse and described the occurrence of burning sensation

skin in an adult female subject who was inadvertently exposed to Pediarix. On 2/24/06 at 11:30am an infant was receiving a dose of Pediarix, some of the vaccine was exposed to the mothers skin. The exposure caused burning. The skin was subsequently flushed with water. The outcome of the event to the mother was not reported.

Diagnostic Lab Data: See attached Records received with report:MRI: normal. CSF Normal.
CDC Split Type:
Write-up: 36 yo recently activated with a history of hyperlipidemia presented 6 days after receiving multiple vaccines in both arms. Patient is left arm dominant and reports 1 day after vaccine receipt, she had right shoulder and arm tenderness which extended up the back of her arm and part of her back for which extended up the back of her arm and part of her back for which she took naproxyn. She reports that on Saturday, 2 days after her vaccinations, she noticed an abnormal sensation on her right cheek and that her right arm "felt heavy". She soon realized that she had a facial droop, right sided ptosis, muffled hearing on the right and altered taste. She sought medical attention at this time where she was diagnosed with Bell''s palsy and was prescribed Valtrex, prednisone and hydroxyzine. Patient states that 4 days after vaccination, she returned for medical care because of increased right arm pain, swelling, and weakness. She was then sent for further evaluation. Patient denied any specific lower extremity involvement, although when pressure on this issue, she reports that her right leg may have felt heavy as well. Pt reports that her right arm feels weaker than her left and she continues to have altered sensation in her right face and right upper extremity that she described as stable. Her right hand has paresthesias primarily in 4th hand and 5th digits. Pt states that she normally uses solar and propane power only, lives with 3 dogs, 2 cats and raises 50 chickens for eating and eggs, and primarily eats only organic foods. Pt denies any similar episodes in the past, history of cold sores, photophobia, HA, meningeal signs, recent autoimmune disease, sick contacts; pt reports several had URIs. 03/30/07-record received with received with report. DC DX:partial nerve palsy of face, high TSH. Symptoms right ptosis, decreased facial grimace. Hemibody numbness, right arm pain, right shoulder pain, stiffness, right facial droop/Bell''s Palsy. Weakness and numbness of right arm, decreased reflexes. Occassional double vision. Right leg heaviness. Per 60 day follow up: Last contact 10/31/06.

Current Illness: Drug hypersensitivity; Acute lymphocytic leukaemia
Preexisting Conditions: Chemotherapy; Hives; Breathing difficult
Allergies:
Diagnostic Lab Data: None
CDC Split Type: WAES0706**USA**02842
Write-up: Information has been received from a registered nurse concerning a 20 year old female with acute lymphocytic leukaemia treated with chemotherapy (1989) and a drug allergy to BENADRYL (hives, trouble breathing) who on 22-FEB-2007 at 10:00, was vaccinated IM into the left arm with a first dose of Gardasil (Lot# 654741/0013U). Concomitant therapy included DEPO-PROVERA. "Within a day or two later," the patient''s left forearm swelled from the injection site to the upper arm after lifting weights of 20 to 40 pounds. It was reported that the patient denied any erythema or itching. Unspecified medical attention was sought. No laboratory diagnostic studies were performed. After 2 to 3 days, the swelling resolved. It was also reported the patient has not yet received the second dose of the vaccine. No product quality complaint was involved. Additional information has been requested. 01/07/2008 This is in follow-up to report(s) previously submitted on 7/16/2007; 10/8/2007. The day following immunization, the patient''s left upper arm and forearm swelled. The patient described that her forearm "swelled to the size of her upper arm". She noticed this after lifting weights (20-40 pounds). It was reported that the patient denied any itching, erythema, SOB, wheeezes or pain. Unspecified medical attention was sought. No laboratory diagnostic studies were performed. On 26-FEB-2007, the patient recovered. No product quality complaint was involved. Additional information is not expected.

Allergies:
Diagnostic Lab Data: Lyme/B12/Folate/TSH/MRI head/ESR
CDC Split Type:
Write-up: In early April of 2007 I was given the Pneumovax vaccine because I had contracted pneumonia earlier in the year. As you know, starting in the latter part of April, I began to have various symptoms (tingling and numbness which started in the extremities and then moved on to include the torso and head, weakness - especially in the knees and general fatigue). You are also

aware that we did do numerous tests including MRI scan and bloodwork, all of which came back negative. These symptoms persisted from the end of April until the present time, gradually diminishing. (I think the symptoms are diminishing because I have implemented a wellness program of more exercise, acupuncture treatments and a detox program) I am feeling MUCH better since I began this regimen, although the symptoms are not yet completely gone, I believe I will return to my former excellent health. I truly believe these symptoms were connected to the Pneumovax shot. I went online and found two web sites which deal with the Pneumovax vaccine. Both of these websites begin by saying there is little risk with this vaccine, HOWEVER, if your scroll down to the "Adverse Reactions" there is a list of reactions recorded in clinical test. Four of those symptoms exactly coincide with mine! I have attached the printout for your information. I am basically writing this letter just to make you aware of the possible risks of this vaccine. I never had a reaction like this to any other immunization in my life. Perhaps you can contact the manufacturer of the vaccine and report my experience, or at least forward this letter to them. I also feel that the manufacturer should reimburse me for the cost of the immunization because I have incurred great medical testing costs in trying to diagnose these symptoms. I hope that you will take the time to consider this information.

Write-up: Information has been received from a registered nurse concerning a 60 year old female (weight 75.4 kg, height 162.5 cm) with ibuprofen (MOTRIN) and Duloxetine HCl (CYMBALTA) intolerance, lipids increased, diabetes mellitus, obesity and hypothyroidism and a history of relapsing-remitting multiple sclerosis, pain in elbow, pain in foot, nausea, chronic back pain, diverticulosis and lipoma who on 25-SEP-207 was vaccinated with a dose of Pneumovax 23 (lot #655290/0959F), IM in the left deltoid. Concomitant therapy included acetaminophen (APAP), cyanocobalamin, interferon deta-la (REBIF), metformin HCl, levothyroxine Na, lisinopril-HCTZ (MSD), omeprazole, red yeast, estradiol (CLIMARA), psyllium husk (METAMUCIL), calcium (unspecified), pyridoxine and vitamin D (unspecified). On 26-SEP-2007, the patient awoke that morning with chills, lightheadness and general body aching. On 02-OCT-2007, the patient was seen by a neurologist who reported that the patient had a clinical relapse of multiple sclerosis. The patient also perceived weakness in her right leg with a heavy sensation, which required her to use a cane for the last 3 to 4 days in order to ambulate with security. The patient was treated with IV steroids for her quit impairment. The outcome of the events was not reported. Chills, lightheadness, general body aching and clinical relapse of multiple sclerosis were considered to be other important medical events. Additional information has been requested.

Diagnostic Lab Data: UNK
CDC Split Type: A0695439A
Write-up: This case was reported by a healthcare professional and described the occurrence of systemic shot reaction in a 30-year-old male subject who was vaccinated with Flulaval for prophylaxis. The subject had no relevant medical history. There were no concurrent medications. No other vaccinations were administered on the date of receipt of Flulaval. The subject had not previously received a flu shot. On 12 November 2007 at 2:00 p.m., the subject received 1st dose of Flulaval (.5 ml, unknown, left arm). On 14 November 2007, 2 days after vaccination with Flulaval, the subject experienced a systemic reaction which included hives, redness and itching. The healthcare professional considered the events were clinically significant (or requiring intervention). The subject was treated with Benadryl and Claritin. At the time of reporting the events were unresolved. The healthcare professional considered the events were probably related to vaccination with Flulaval.

Diagnostic Lab Data: Neurological exam on November 20, 2007 revealed normal tendon reflexes in the legs, diminished in arms. Electric reflex stimulation demonstrated conduction velocities in normal range. Clinical exam demonstrated complete loss of resistance to pull in distal flexors of left thumb and first 2 fingers, weakness on right side. Labs and Diagnostics: EMG and NCS 11/20/07 normal. H.pylori (-). CBC, UA and Chem WNL.
CDC Split Type:
Write-up: Received Flu shot on November 15, 2007. Developed fever that night. On November 16, had fever and generalized muscle soreness, most pronounced in shoulders. November 17 and 18: progressive loss of strength and motor function in the hands, fatigue, continued fever and increasing muscle soreness. November 18th: fever resolved, but saw physician at clinic for continued soreness, fatigue, and loss of motor function in the hands. Referred to Neurology on November 20. Diagnosed with Parsonage-Turner Syndrome (acute brachial neuritis). Motor function in hands resolved without treatment within 2 weeks following visit with Dr., with minor residual weakness. Fatigue continued to present. 01/18/2008 MR received for Clinic visits 11/18/07 and 1/02/2008. Pt c/o fever, bil hand pain initially then hips and ankles, and muscle weakness. Weakness to hands (L$gR) noted on PE. Reflexes 1+ in upper extremities, 2+ lower. Seen by neurology 11/20/07 for EMG and NCS DX: Acute Brachial Neuritis. Seen again 01/02/08 with fatigue and nausea since visit in Nov. Exam WNL. Impression: Nausea, Possible GERD, Fatigue

CDC Split Type: WAES0712**USA**02074
Write-up: Information has been received from a medical writer concerning his 19 year old daughter with a history of chronic yeast infections, gets easily nervous and is allergic to BACTRIM who on 05-DEC-2007 was vaccinated with the first "standard dose" of Gardasil (lot # not reported). Concomitant therapy included DEPO-PROVERA. On 05-DEC-2007 after receiving the first dose of Gardasil, the patient experienced intense injection site pain. Within an hour of administration the patient developed nausea and lot sensation of her arm. Her hand turned purple as if her circulation had diminished. The patient felt almost intoxicated and had slurred speech. The patient had no hives and not itching but felt hot. The patient went to the emergency room and her symptoms disappeared except for the injection site pain. She was told to take ibuprofen and apply ice packs to the area and the patient was released. Neurological tests (eye and head movements) were performed at the emergency room (results not provided). The patient''s outcome was reported as recovering. Additional information has been requested. Follow-up information received on 23-JAN-2008. On 06-DEC-2007 the patient''s father contacted the physician''s office and reported that on 05-DEC-2007 his daughter could not feel her left arm, that she was confused and felt her speech was slurred. The patient reported that she was told by the nurse that the vaccine GARASIL causes discomfort once injected into site and that another nurse held her down. A nurse was asked to come in and assist by talking to the patient because patient was so anxious and acting somewhat inappropriate. At no time was the patient held down. Patient was asked several times if she wanted injection and she stated yes. Patient''s father reported that his daughter''s arm was purple when he picked her up and that her speech was slurred. Patient seen at the immediate care center. Patient''s father stated he spoke with the manufacturer and that they recommended tha patient not have the second and third dose. The nurse attempted to call patient back the day following vaccination with no success. Physician''s notes: The physician reported that the patient experienced localized discomfort after a vaccine injection. The 19 year old female seen at the physician''s office was given a dose of GARDASIL at 11:45 hours in the region of the left deltoid. She waited 15 minutes and was discharged. At or about 12:45 she began noticing a discomfort in the area of the injection (she did notice some immediate and acute pain at the time of the injection) associated with eventual numbness of an odd degree in the left hand and forearm. She also noticed because of the intense pain, nausea and there was no dizziness, she did not feel itchy, rash or hives did not develop, and at no time did she vomit. At the time of evaluation, she felt like she had tenderness at the site of the injection. She felt her speech was abnormal although on exam evaluation, speech appeared normal and she was a little nauseated. She never vomited. During examination the patient had no acute distress. Her body temperature was 98.3, pulse of 79 and regular. Respiratory rate of 16 and regular. Blood pressure was 108/66. Oxygen saturation on room air was 98 to 99%. Ears were normal. Throat and mouth including mucus membranes were normal. Neck was supple trachea is midline. Lungs were clear. Skin was normal. Cardiac exam revealed regular rate without murmur, gallop, or rub. Abdomen and extremities were benign. Neurological exam revealed the patient was oriented x three. Grips and strength was normal. There was tenderness in the region of the deltoid injection on the left, but there was no redness and no fluctuance and no induration. The patient was observed for a period from 13:48 hours until time of discharge at 1500 hours. The patient evidenced no progressive nature of symtoms and in fact some of them improved. The patient was indicated to take ibuprofen as needed and ice off and on. She was instructed to follow up with the physician if not during

better. No additional information is expected.

Allergies:
Diagnostic Lab Data: Labs EKG - Seen by cardiologist ER LABS: CBC, chemistry, cardiac enzymes, UA all WNL. Hospital LABS: EKG revealed bracycardia. Echocardiogrm WNL. Stress test WNL.
CDC Split Type:
Write-up: Immediately after shots - became Faint with pulse 50; Next Am had syncopal episode - $g ER -$g hosp Adm. with significant bradycardia -$g cardiac work-up; now on Atenolol. 2/1/08 Reviewed ER medical records of 11/15/07 which reveal patient experienced feeling lightheaded, warmth & nauseated. Felt faint, lost consciousness & collapsed for approx 1 min witnessed by parent. Recovered at the scene. In ER placed on O2. Had additional episodes of syncope w/HR 30''s while laying on gurney in ER. Noted to have eye twitching, pallor & eyes rolling back in head, flaccid. Awoke immediately but was very tired. Transferred to higher level of care. FINAL ER Dx: syncope of unknown cause. 2/8/08 Reviewed hospital medical records which reveal patient

admitted to PICU 11/15-11/16/2007. Cardio consult done. Syncopal episodes felt to be neurocardiogenic w/significant cardioinhibitory component, resulting in secondary bardycardia/asystole & syncope. Tx w/meds & hydration & d/c to home w/cardio f/u. FINAL DX: syncope, probably neurally-mediated syncope; periods of marked bradycardia.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Per patient: On Friday evening, my left arm (where I got the tetanus/pertussis shot) started aching. I woke up in the middle of the night in extreme pain, unable to move that arm, feeling very nauseous and dizzy. My arm was very swollen, hot, hard and red. I felt awful on Saturday and paged your doctor on call, who advised me to go to the ER. I had made it up to my parents house and planned on going to the ER there, but I took my temperature and it was normal, and I just felt like I wanted to sleep, so I took some Advil and slept for 14 hours at their house. Sunday I still felt awful, no change in my arm, but I drove home. Monday I continued to have flu-like symptoms -- dizzy, nauseous, achy, and my arm remained swollen, tender, hot and red. I did not go to work, and insisted on taking me to the ER. My temp was still normal, but my BP was very low (90/66), and the PA I saw thought I had a systemic infection going on from the vaccine, and put me on antibiotics. I missed work again on Tuesday. I started feeling a little better on Weds. and went back to work. My arm has started to feel better, but I still have flu-like symptoms. Today I have taken 9 Advil since this morning and still have a splitting head and neck-ache and my arm is aching. I am having a hard time getting comfortable enough to sleep feeling this achy and am not sleeping well. I feel really run down and exhausted. I don''t think I simply caught the flu because of the onset of the symptoms in conjunction with the vaccine, and also b/c I am not vomiting or congested... just in pain and exhausted. I am also still quite dizzy. I am toughing out work b/c I have a lot going on right now and couldn''t stay out any longer, but am feeling just lousy.

Current Illness:
Preexisting Conditions: Non smoker. Patient had chicken pox in her youth. History of NAFLD - non-alcoholic fatty infiltration of the liver - mild. Allergic to codeine, sulfa. PMH: chronic left OM w/mastoid cavity s/p perforation
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient received Zostavax 2 1/2 weeks ago. She developed right sided head pain 2 weeks ago, right facial pain and sensitivity 1 week ago and rash on face 3 days ago consistent with a clinical case of Zoster -shingles- involving the trigeminal nerve 1st and second branch. No eye involvement thus far. 7/15/08 Reviewed PCP medical records of 5/12-6/9/08. FINAL DX: Facial shingles w/trigeminal nerve involvement Records reveal patient w/left ear drainage & pain on 5/12 & tx w/topical & oral antibiotics. RTC 6/9 with shooting pain right scalp x 2 wks which had progressively gotten worse. Facial rash x 2-3 days w/burning sensation. Exam revealed erythematous papules & vesicles on right face w/ulcerations, hemorrhagic crusts, increased touch sensitivity over face & right scalp. Tx w/antibiotics & pain meds. Follow-up: The patient developed clinical zoster a few days after receiving the vaccine. The rash cleared after 3 weeks, but pain persisted despite Acyclovir and gabapentin initially. Gabapentin ongoing for about 6 more weeks. She had recurrence of similar pain mildly 6 months later which resolved after about 1 week without Rx. Today feels well.

Current Illness: Right thigh puncture wound on new nail
Preexisting Conditions:
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: The patient received Tdap immunization for puncture wound of the thigh at this clinic on July 9. She had an immediate reaction consisting of numbness and pain from the armpit down to the middle of the forearm. She told the nurses and she was observed for at least a half an hour. The pain gradually subsided. By the next day, she had minor pain and discomfort. Since then, she has had persistent minor pain and discomfort with a hard time sleeping because of a sensation of her arm falling asleep. She indicates the area of discomfort is from the axilla to the mid forearm, but she also has minor tingling of the fingers, which is occasional. She notes that there might be increased tingling of the fingers depending on the position of her elbow and shoulder. She is usually healthy. Past medical history is negative (Gravida, Para, seven years ago). The patient takes no medications and has environmental allergies. Her daughter had a reaction to her MMR, again given at this clinic, a couple of years ago. She looks well. She has full range of motion of the neck, which does not increase her discomfort. There is full range of motion of the shoulder, which produces some discomfort as she lowers the arm from full abduction. Deep tendon reflexes are 2+ in biceps, triceps, supinator and knees. Ankle reflexes are absent. There is good strength of all muscle groups of both arms. There is no sensory loss to vibration in the fingers. On inspection of the shoulder, there is no obvious swelling, but there is a patchy fading ecchyinosis approximately 3 cm in diameter of the skin overlying the deltoid. Sounds like an immunization reaction, which has persisted. Notify manufacturers. Request neurological opinion to be arranged for this week since she will be leaving for another city at the end of the week and has no regular physician in the other city.

Write-up: Information has been received from a registered nurse concerning a 75 year old female with no pertinent medical history and no history of drug reactions/allergies who on 14-AUG-2007 was vaccinated with PNEUMOVAX 23 (lot # 655289/0958F) 0.5 ml IM in the left triceps. There was no concomitant medication. On 14-AUG-2007, the patient experienced an injection site reaction when the patient got home from the vaccination. At an office visit on 17-AUG-2007, the reaction was described as a red, tender, warm area with induration at the injection site that was 16 by 17 mm. The injection site reaction was characterized as possible cellulitis. On an unspecified date, a complete blood count was performed, no results reported. The patient was given a prescription for KEFLEX 500 mg three times a day for 7 days. The patient was contacted by the nurse by phone on 24-AUG-2007. The patient recovered on 27-AUG-2007. The registered nurse considered the events to be disabling. The nurse requested a lot check. A standard lot check investigation was performed. All in-process quality checks for the lot number in question were satisfactory. The lot met the requirements of the government and was released. Additional information has been requested.

Previous Vaccinations:
Other Medications: Tuberculin purified protein
Current Illness:
Preexisting Conditions: Unknown
Allergies:
Diagnostic Lab Data: complete blood cell, results pending
CDC Split Type: WAES0810**USA**00220
Write-up: Information has been received from a physician concerning a 42 year old male surgeon with no allergies or medical history who on 22-SEP-2008 was vaccinated subcutaneously in the left arm with a "suspected" 0.5 ml second dose of MMR II (lot # 656428/0203U). Concomitant therapy included a dose of tuberculin purified protein derivative in the right arm. Five days later, on 27-SEP-2008, the patient developed malaise, tiredness and possibly fever. On 29-SEP-2008 the patient developed soreness and achiness up and down triceps of his left arm. Unspecified medical attention was received in the physician''s office. The patient is taking 1600 mg of ibuprofen daily. A complete blood count was drawn and the results are pending. The patient was reported as not recovered from malaise, tiredness, possibly fever and soreness and achiness up and down triceps of left arm. The reporter stated since the patient was a surgeon there was some mild disability. A product quality complaint was not involved. Additional information was received from the health care provider that the patient experienced no congestion or other viral symptoms and reported having low energy. On "Monday" the patient had chills and a painful mass-like area around the injection site. The patient reported feeling slightly sick to his stomach at some point. The patient treated himself with LEVAQUIN. The reporting health care provider suspected myalgia. The patient''s triceps were slightly warm, tense, with no mass felt, but "mass" appeared to be traveling down the arm and extending. The patient''s skin appeared normal with no joint symptoms reported. Additional information has been requested.

Preexisting Conditions: Cold sores lip
Allergies:
Diagnostic Lab Data: None
CDC Split Type: WAES0806**USA**02192
Write-up: Information has been received from a registered nurse concerning a 65 year old female, weight 147 pounds height 61 inches, with a history of oral cold sores who on 29-MAY-2008 at 13:30 was vaccinated with the first dose of ZOSTAVAX (Oka/Merck) subcutaneously (lot#: 659614/0161X). There was no concomitant medication. Within an hour after vaccination, the patient stated she had a "cold sore" on her lip. The patient had a history of cold sore on lips, but she stated it had not occurred in awhile. The patient felt strongly it was related to the vaccine. She was unable to take her anti-viral medication due to the vaccine. After 2-3 days, the patient recovered from cold sore on lip. It was unspecified if the patient sought medical attention. Additional information is not expected.

CDC Split Type: MEDI0007561
Write-up: A non-serious spontaneous report of fever, vomiting, chills sore throat, and runny nose has been received from a nurse concerning a four- year old female subsequent to FLUMIST. This case is submitted in accordance with MedImmune"s post-marketing commitment on accelerated reporting for the newly indicated population of 2 years to 59 months of age for FLUMIST. Neither past medical history nor concomitant medications were reported. The patient received FLUMIST on 25-Nov-2008. The patient woke up on 26-Nov-2008 with a fever, vomiting, chills, sore throat, and runny nose. The outcome was not reported. The events of fever, vomiting, chills, sore throat, and runny nose resolved on approximately 03-Dec-2008, within one week after the onset of the events. Additional information received 08-Jan-2009 and incorporated into the case outcome and resolution date.

Previous Vaccinations:
Other Medications: Prinivil; Mevacor
Current Illness: Thyroid disorder; Sulfonamide allergy; Drug hypersensitivity; Hypertension
Preexisting Conditions: Glaucoma
Allergies:
Diagnostic Lab Data: Erythrocyte, 34; Serum cyclic citrulline, 250
CDC Split Type: WAES0903**USA**01845
Write-up: Information has been received from a 91 year old female patient with an unspecified thyroid disorder, recent diagnosis of hypertension, nitroglycerin allergy and possible Sulfonamide allergy and with a history of glaucoma; who on 26-MAR-2008 was vaccinated with ZOSTAVAX (Lot # 659403/1825U), subcutaneously in the left arm. Concomitant therapy included an unspecified thyroid medication, Lovastatin (manufacturer unknown) and Lisinopril (manufacturer unknown). The consumer reported that on approximately 26-APR-2008, one month after receiving ZOSTAVAX, she developed rheumatoid arthritis. The patient started having pain and difficulty moving her left arm one month after receiving the vaccine. The pain and swelling progressed to her right hand, fingers and knees. The patient''s physician prescribed Methotrexate. The patient stated that she was hospitalized on 22-JAN-2009 because the Methotrexate caused to have

respiratory problems. Methotrexate was discontinued. On unspecified dates rheumatoid factor, antinuclear antibody and Lyme disease titer tests were performed with unreported results. Multiple blood test performed on unreported dates included sedimentation rate of 34 and cyclic citrullinated peptide antibody of 250. At the time of the report, the patient had not recovered. The patient sought medical attention and visited physician''s office. Additional information has been requested.

Preexisting Conditions: s/p Renal transplant 5/4/2007
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Pt went to a pharmacy clinic to receive Zostavax. Pt is s/p renal transplant and on chronic immunosuppression. Screening questionnaire used was downloaded from your (CDC) site per pharmacist on later inquiry by me. Immunosuppression is addressed but transplant is not specifically mentioned. THE PATIENT DOES NOT READ OR WRITE (unknown by pharmacist). The patient was immunized. Fortunately, there was no adverse reaction. (Specific date and time of vaccination are not known by me; did try to obtain from pharmacist. Pt unsure and family was not aware.)I am basically reporting in hopes of getting you to change your screening form to specifically mention transplant as a contraindication. Many health care providers and patients call us to ask if transplant patients can be vaccinated. This gentleman could have had a much worse outcome. Not all patients make the connection between immunosuppression and transplant. Pharmacist was not particularly concerned; I called him at the request of the patient''s primary care provider who I had alerted to the situation. He also thought the pharmacy might change the form. After alerting our pharmacies of the situation, we have changed our screening form to specifically mention transplant.

Allergies:
Diagnostic Lab Data:
CDC Split Type: 200802894
Write-up: Initial report received on 16 September 2008 from a healthcare professional. A 31 year old female, with no medical history and who was using Nuvaring, received on 11 September 2008, a left deltoid intramuscular injection of ADACEL (lot number C2768AA). Her last "td" vaccination was in 2000 and adverse event following prior vaccinations was unknown. After an unspecified amount of time on the day of vaccination (11 September 2008), the patient complained of blurred vision, lightheadness and warmth at the injection site. She went to the emergency room. Corrective treatment was not reported. The patient''s recovery status was reported as unknown. Follow-up information was received 02 October 2008 from a health care professional who confirmed that the patient had recovered from the event (date of recovery not reported).

Diagnostic Lab Data: None
CDC Split Type:
Write-up: Evening after immunization - body became "itchy" esp. feet. Next day facial and chest rash - face very red. May have had temp. elevation - did not have thermometer. Took Ibuprofen for relief. Felt achy and tired by 10/20/09. Symptoms much less, face still red. From 10/16 - 10/20 denies throat tightness, sore throat, sneezing, cough. Patient/employee reported this reaction on 10/20/09 with phone call received by reporting nurse. This is the first seasonal flu shot this patient/employee received. Eggs tend to upset her stomach so she avoids them but does eat them occasionally.

Other Medications:
Current Illness: The patient was a breastfeeding mother at the time of vaccination.
Preexisting Conditions: Patient had a history of asthma, fibromyalgia and known allergies to penicillin, sulfa and latex. The patient may have received a flu vaccination three years ago. She had no adverse events following prior vaccinations.
Allergies:
Diagnostic Lab Data: None
CDC Split Type: 200904927
Write-up: Initial report received from a health care professional on 11 November 2009. This report involved a case of misuse where the patient received two pediatric doses of FLUZONE combined into one injection. A 35-year-old female patient with a history of asthma, fibromyalgia and known allergies to penicillin, sulfa and latex and who was breastfeeding mother at the time of vaccination, had received an intramuscular right deltoid injection of FLUZONE, lot number U3262HA on 10 November 2009 at 11:30 am and five minutes later, she developed injection site swelling and cold hands. Benadryl was administered and the patient was sent home. At 3:00 pm, the patient went to emergency room with complaints of hives, malaise, fatigue, headache and fever of 102F and was released. At 3:00 am, the patient returned to the emergency room with the same symptoms in addition to left breast pain. The patient was diagnosed with mastitis. The patient had no concurrent illness and she had not been taking any concomitant medications at the time of vaccination. She had no adverse events following prior vaccinations. At the time of the report, the patient''s recovery status was unknown. Documents held by sender: None.

Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Student became pale, clammy. After rest and hydration student continued to feel "off." His vital signs were WNL. Parents were called and he went home to rest. Parents reported he felt fine all day and night. The following AM student woke with swollen eyes. The parents were unclear if this was due to cat exposure and student''s allergy to cats or a flu shot reaction. Student referred to MD and was seen 22.5 hours after receiving the vaccine. Parent reported there was no swelling, redness at site of injection, no malaise felt. MD suggested Benadryl and monitoring at home.

Previous Vaccinations:
Other Medications: none
Current Illness: none
Preexisting Conditions: none
Allergies:
Diagnostic Lab Data: The doctor was not concerned about the shot and I do not think he reported my findings. On 2/24/10 I told the nurse about my concerns. She asked to see his shot record and what she found scared us both. On 12/07/09 she was given .5 of the H1N1 shot and on 01/08/10 he was given another .25. This is a total of .75 way more than an adult dose. My grandson was overdosed and may be damaged for life, because of this. I no longer have that genteel little boy. If you can give me advice on what to do, Please let me know.
CDC Split Type:
Write-up: My grandson went from a genteel and loving child to an aggressive and unpredictable child, this is still continuing today. He had loose and smelly bowel movements for about two weeks after each H1N1 shot.

Diagnostic Lab Data: serum varicella zoster, 09/01?/09, negative
CDC Split Type: WAES0909**USA**00222
Write-up: Information has been received from a registered nurse concerning a 5 year old female with no pertinent medical history and no known drug allergies who on 27-JAN-1999 was vaccinated with the first 0.5ml dose of VARIVAX (Merck) (subcutaneous injection, lot # 628147/1262H). There was no concomitant medication. The nurse was reporting that on 05-FEB-1999 the patient developed itchy rash on face, ears, nose, and hands after receiving her first dose of VARIVAX (Merck). On approximately 01-SEP-2009, the patient had the titer done, but it came back as negative for varicella immunity. On unspecified date, the patient recovered. On unspecified date, the patient saw the physician. Follow up information has been received from a healthcare professional indicated that a 6 year old (previously reported as 5 year old) patient experienced rash on 27-JAN-1999 (previously reported as 05-FEB-1999). Additional information is not expected.

Previous Vaccinations:
Other Medications: I have no way of knowing any of this information. My health care provider

administered this. They didn''t disclose lot numbers or any kind or manufacturer. I was told it was Influenza 2010-2011
Current Illness: NO
Preexisting Conditions: no
Allergies:
Diagnostic Lab Data: I contacted my Dr''s office and explained everything. The nurse I spoke to acting like this type of stuff wasn''t normal. She said she would note my medical file.
CDC Split Type:
Write-up: First sign was a burning sensation in my arm that lasted over 1 hr. Then beginning at 4:30 pm I felt tickling in my nose. Blowing my nose ongoing until 8:00 pm then violent sneezing, eyes began itch and swollen. Eyes were running and throat felt very bad. I was experiencing what I would call a severe allergic reaction. I have never experienced anything like that.

Previous Vaccinations: Hives~Influenza (Seasonal) (no brand name)~~31.00~Patient
Other Medications:
Current Illness: No
Preexisting Conditions: Developed hives after 2009 flu vaccination which slowly improved throughout the year but did not resolve. Otherwise healthy.
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: Developed a severe chronic hive outbreak following flu vaccine. No known allergy to eggs or chicken. No history of hives prior to receiving the 2009 flu shot. In 2009 hives developed several days after receiving the flu shot. Medication was prescribed and the condition could be controlled by the medicine. Several days after receiving the 2010 flu shot, the condition has returned with a vengeance and cannot be controlled even with medication. I suspect that the flu shot has created a chronic hive condition that will not be easily resolved.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient became unusually fussy and could not be consoled easily. Wasn"t nursing well. Fell asleep around 10pm and woke up around 1am with 101-102 fever. Treated with infant ibuprofen. Fever went down to 99-100. Fever/treatment continued for next day. That evening (12/29) noticed three areas of red blood in stool. Called PCP and was told it was likely an anal tear. Patient is breastfed so no straining to have movement, and movements had been normal. Continued fussy for next day. On 1/1 developed dry cough and some chest congestion. Eating normally, and having regular wet/soiled diapers. Was not ill prior to shots (Prevnar 13 and Hib), does not attend daycare and has not been exposed to sick people.

Diagnostic Lab Data:
CDC Split Type:
Write-up: Patient woke from her nap crankier than normal; within an hour, she was screaming inconsolably. Her legs became red and swollen at each vaccination site. She seemed to be running a slight fever, but nothing over 101F. At our pediatrician''s advice, we gave her a dose of infant Tylenol, and applied cold compresses to the vaccination sites; this eased her discomfort. We needed to repeat the Tylenol at two more doses to keep her from becoming extremely upset at those times; irritability continued for about 36 hours after the vaccination.

Previous Vaccinations:
Other Medications: Forteo, Ambien
Current Illness: no
Preexisting Conditions: osteoporosis, irregular heartbeat
Allergies:
Diagnostic Lab Data:
CDC Split Type:
Write-up: After check-out I was looking over the sales slip and re-arranging items in cart. I took

one step backwards and tripped over the "barrier" cone in front of the customer service desk. I fell over backwards, landing on right buttocks and head. It''s possible that I fell as result of dizziness from the vaccine shot, but more likely that I was simply not watching my step. I''m in good physical shape and in fact just before the vaccine I participated in an aerobics class. Alerted doctor''s office and advised to use ice on buttock injury.

Write-up: See attached. I saw her 10/10/11 when her sister was in. Still has a 6cm x 4cm bruise. It doesn''t hurt, but it is hard to tell which vaccine. Looks like MMR. I spoke with mom and she said it was her left arm. Unaware which vaccine it was. She couldn''t tell me if it was deltoid or back of her arm. But she says its about the size of patient''s hand, and hot to the touch. A little bruising. I told her ice and MOTRIN, she said she only had TYLENOL and I said that was fine but it may not work as well. She could have 2 tsp of childrens. I told her to draw a circle around it and to call back in the am and tell us how much bigger it spreads. If it gets too large and she is worried I said nurse is on call and she will talk to her. If it gets too big we need to see her and do a VAERS report. She is still able to move her arm fine, she just doesn''t like people touching it.

Write-up: I became achy and feverish flu like sysmptoms. Apporx 9:30pm at my residents Ibegan to experince chills, Fever, soreness and dizziness. Approx. 11:30pm I was experincing an extremely high temp. (106*)severe chills, dizziness, disorientation, rapid heart beat and vomiting. Throughout time line I was drinking water and taking 800ml of Ibuprofen. Approx 1:30am on 10/18/11 my Fever and symptoms started to reside. Temp dropped (104*) chills started to subside and Vomiting stopped. Approx 3:00am body temp was down (101*) chills almost gone and hot burning sensation disappeared too. Approx. 5:45am awoke after a couple of hours of sound sleep. Except for light headedness and feeling of being tired all sysmptoms had gone. Approx 7:00am on 10/18/11 I had only a bad headache and nasal stuffiness type feeling left. Approx 9:00am I called my Doctor reported reaction event and was advised to continue Tylenol or Ibuprofen. Approx 5:30pm on 10/18/11 all symptoms gone. Felt fine.

Allergies:
Diagnostic Lab Data: Bronchoscopy, blood drawings
CDC Split Type:
Write-up: I got my Flu shot around 3 in the afternoon on Sept 16th, and was in our local ER bleeding from my lung that night. Doc"s at hospital (was shipped via ambulance from our local hospital) came in next day telling me my WHITE BLOOD CELL COUNT WAS LOW AND CONCERNED THEM (I highlighted in Red the first "reaction" shown in the box below)...So for a short "window of time" after the Flu shot (approx. 24 hours all told), these things happened. Thrombocytopenia (abnormally low platelet count, which can result in abnormal bleeding) My note: this is what happened to me after getting Flu shot earlier in the day...I had a LOW white cell count that concerned Docs the following day! And was bleeding from my left lung! One of the Serious adverse events in your package insert. I definitely will never get another Flu shot of any kind for any reason. I was NOT informed that the shot I was getting was 4 times the amount of flu bug as the regular shots...I feel like a guinea pig being used for experimentation without my knowledge or consent! Apparently the injection set my white cells on the attack due to your products invasion, and I could not produce them fast enough, resulting in the LOW cell count, resulting in the bleeding...

Previous Vaccinations: Sore arm Low Grade Fever~Influenza (Seasonal) (no brand name)~~41.00~Patient
Other Medications:
Current Illness: none
Preexisting Conditions: none
Allergies:
Diagnostic Lab Data: none
CDC Split Type:
Write-up: 24 hours after the vaccine was administered, patient developed a low grade fever and sore arm. She took Advil. At 3:30 pm she spiked a fever and had chills. 6:30 pm her heart was racing, temp 103.5. She called her MD on call. He recommended Benadryl (patient did not have any) and cold compresses. 8:30 pm Temp 102. 11-11-11 2 Am Had chills and temp 102. Took Tylenol. Woke in am with achiness and continued painful right arm. Temp now gone but arm painful with resistence. She said the arm does not have redness or swelling but there is a bruise. She said it does not appear infected. I recommended she follow up with her provider if the arm does not improve and could try warm compresses or ice (which ever felt better to her to help decrease the pain. On a scale of 1-10, at it''s worst the pain was a 7 and now is a 2.

CDC Split Type:
Write-up: I am requesting that your office file this Vaccine Adverse Event Report. Here is my experience regarding Tdap vaccine. Prior tetanus shots (alone and with other vaccines) in the military and locally provided no adverse reactions. 10/27 9:30am. Vaccine administered. 12 noon Had lunch. 2pm Felt tightness in upper digestive tract. 5pm Could not eat supper. Upper tract still blocking digestion. 6pm Went to bed. Slept the night with poor digestion. Had chills and then fever. Did not take temperature. 10/28 Stayed in bed all day and night. Had continuing diarrhea and headache. Very tired not wanting to accomplish anything. No pains or redness at site of vaccination. 10/29 Continuing diarrhea. No headache. Tired, not wanting to accomplish anything. 10/30 Better, still some stomach discomfort. I have checked all symptoms experienced on the yellow sheet attached. This was supposed to be just a tetanus booster. I accepted that Tdap was appropriate. My concern is that this process was just part of a trial for the combined vaccine. Why would it be administered to a 76 year old? Your feedback will be appreciated and that the report was filed. 10/31/11 Call placed to pt, pt feeling better. He would like his symptoms reported.

Current Illness: Unknown
Preexisting Conditions: The subject has no known relevant medical history and no known history of adverse events following previous vaccinations.
Allergies:
Diagnostic Lab Data: UNK
CDC Split Type: A0930139A
Write-up: This prospective pregnancy case was reported by a healthcare professional and described the occurrence of vaccine exposure during pregnancy in a 38-year-old female subject who was vaccinated with TWINRIX adult (GlaxoSmithKline) while pregnant. Concurrent vaccination included ADACEL (Sanofi Pasteur) and PPD given 12 May 2011. On 12 May 2011 at 09:30 and 12 April 2011 at 14:00 the subject received 2nd dose and 1st dose of TWINRIX adult (1 ml, unknown, left deltoid). The subject experienced vaccine exposure during pregnancy. It was reported that the subject visited the emergency room presenting with pelvic pain, but was not admitted to the hospital. At that time, it was determined that the subject was 6 weeks pregnant. Her date of last menstrual period and estimated date of delivery were not known. The pregnancy was ongoing at the time of reporting.

Diagnostic Lab Data: Magnetic resonance, Brain: Conversion
CDC Split Type: WAES1204**USA**02620
Write-up: Information has been received from a consumer concerning currently 15 year old female patient with no pertinent medical history and no drug reactions/allergies who on an unspecified date, was vaccinated with the second dose of GARDASIL (lot # and route not reported) 0.5 ml. There was no concomitant medication. Consumer reported that on an unspecified date, minutes after getting her second GARDASIL dose, the patient had a seizure and was taken to the emergency room (ER) of an unspecified hospital. They did a magnetic resonance imaging (MRI) of her brain and the diagnosis was a conversion, which was a misfiring of the electrons in her brain due to traumatic bodily injury. Since this happened, she had had headaches, passed out all the time. she had tingling in her hands and feet, blurry vision, pain in her rib area, and a loss of memory of the last three years. She went to an unspecified neurologist, who could not pin it to the vaccine. She had missed 55 days of school since the event started. The patient''s mother said that physician dismissed the idea that it was due to the vaccine, so she switched to an unspecified doctor in the same practice. The consumer had been to the emergency room (ER) multiple times. It was reported that the events occurred after reintroduction. It was also reported that these events were a significant disability. It was not know if the days of school the consumer missed were consecutive and if the patient was ever admitted to the hospital. At the time of the report, the patient''s outcome was unknown. Therapy with GARDASIL was discontinued after the events happened. Additional information has been requested.

CDC Split Type: WAES1207**USA**001659
Write-up: This spontaneous report was given from a Nurse Practitioner concerning her 4 year old granddaughter with no pertinent medical history or drug reactions/allergies who on 13-MAY-2009 was vaccinated with the first dose of VARIVAX (Merck) (dose and route not provided) (lot# 663819/0336Y, expiration date on 13-MAR-2011) and on 12-AUG-2009 received the second dose of VARIVAX (Merck) (dose and route not provided) (VARIVAX) (lot # 0803Y). There were no concomitant medications. The nurse reported that "early last week" on approximately 25-JUN-2012 her granddaughter was diagnosed with severe widespread chickenpox. The patient developed a fever of 102. The nurse indicated that the chickenpox rashes were "everywhere" on her granddaughter, including between toes and around genitalia. She was treated with CALADRYL lotion to the lesions and a topical mixture of MYLANTA and BENADRYL to the oral lesions. No laboratory test were performed. At the time of the report, the patient had not recovered from the event. The patient sought medical attention at the physician''s office. Additional information received from the nurse practitioner revealed that her granddaughter was tested and it turns out that she had "coxsackie virus". The patient''s outcome for "coxsackie virus" was not provided. It was noted that the nurse practitioner daughter also developed lesions and was tested and it turns out that she had "coxsackie virus" too. This is one of several reports received from the same source. Additional information has been requested.

Write-up: Information has been received from a registered pharmacist concerning a 66 year old female who on 09-MAY-2012 was vaccinated subcutaneously with ZOSTAVAX (Merck) (Lot #: 672868/0239AE). The pharmacist stated that on 09-MAY-2012 the patient experienced a 4 inch rash at the injection site with swelling. 50 mg BENADRYL had been given for AE. The patient did not seek medical attention. At the time of reporting, the patient was recovering. Follow up information was received from a registered pharmacist concerning 66 year old mother patient who on 09-MAY-2012 at p.m., was vaccinated with the first dose of ZOSTAVAX (lot #672868/0239AE) at pharmacy. It was reported that on 20-MAY-2012 at a.m., the patient experienced itching and redness extending beyond injection site by 4 inches all around. No serious illness noted from vaccine. At the time of the report, the patient''s outcome regarding itching and redness extending beyond injection site by 4 inches all around was unknown. The patient did not seek medical attention. The relatedness for itching and redness extending beyond injection site by 4 inches all around was unknown for ZOSTAVAX. Additional information has been requested.

Write-up: Information has been received from a licensed practice nurse concerning a 19 year old male patient with no pre-existing allergies and no medical conditions who on 09-JUN-2012 was vaccinated into left arm with a dose of GARDASIL (lot # 672834/0131AE). Concomitant therapy included a second dose of MENACTRA (lot # U3906AA, into left arm) given on the same day. No other concomitant therapy. On 09-JUN-2012 the patient fainted within 1 minute after administration with vaccine. Head and feet were elevated. Ice pack was applied. Ammonia inhalant was used to bring patient aware. Blood pressure was 100/60 and pulse was 60 at AM 8:55. Patient escorted to exam room and monitored with head and feet elevated for additional 20 minutes. Blood pressure was 112/73 at 9:15 AM, patient was examined by doctor. Then patient was OK to leave facility without complaints of discomfort. Patient stated he was OK. Patient called office when he arrived home. This is one of several reports received from the same source. Additional information has been requested.

Previous Vaccinations:
Other Medications: No other medications
Current Illness: Unknown
Preexisting Conditions: Convulsion, one seizure as a child
Allergies:
Diagnostic Lab Data:
CDC Split Type: WAES1208**USA**004035
Write-up: This spontaneous report was received from a physician refers to a 14 years old female patient with a history of one seizure as a child, who on 07-OCT-2011, 08-DEC-2011 and on 12-APR-2012, was vaccinated with the first, second and third dose of GARDASIL respectively (doses, routes and lot numbers not reported). No other co-suspects were reported. No concomitant medications were reported. The physician reported that about a month ago, in approximately July 2012, the patient developed unexplained alopecia after completion of the GARDASIL series. No treatment was given for the experience. No lab diagnostics studies were performed. At the time of the report, the patient had not recovered. The relatedness for the patient had developed unexplained alopecia after completion of the GARDASIL series was unknown for GARDASIL. This is one of several reports from the same source. Additional information has been requested.

Previous Vaccinations:
Other Medications: Aspirin; Multivitamin
Current Illness: Unknown
Preexisting Conditions: The subject had no known drug allergies. There was no history of previous flu shots and; therefore, no history of adverse reactions following previous flu shots.
Allergies:
Diagnostic Lab Data: UNK
CDC Split Type: A0961037A
Write-up: This case was reported by a healthcare professional and described the occurrence of arm discomfort in a 67-year-old male subject who was vaccinated with BOOSTRIX (GlaxoSmithKline). Concurrent vaccination included PNEUMOVAX 23 (Merck) given on 7 December 2011. Concurrent medications included aspirin and multivitamins. On 7 December 2011 at 15:30 the subject received a dose of BOOSTRIX at 0.5 ml in the right deltoid. On 7 December 2011, less than one day after vaccination with BOOSTRIX, the subject experienced arm discomfort and arm weakness. At the time of reporting the events were unresolved. It was reported that the subject was due for a doctor''s visit soon and an assessment would be made at that time.

Extended hospital stay? No
Previous Vaccinations:
Other Medications: Azithromycin for a sinus infection.
Current Illness: Yes, he was on medicine for a sinus infection.
Preexisting Conditions: He was diagnosed with epilepsy on November 22, 2012. He was born with full body petechiae.
Allergies:
Diagnostic Lab Data: He was tested for leukodystrophy among many other things, but all of his blood tests came back okay. He had an MRI and an EEG which confirmed epilepsy.
CDC Split Type:
Write-up: He starting running a fever on November 16th, that night he woke up screaming several times, his eyes were all glazed over, and he was petrified. I thought they were just nightmares. The morning of November 18th, he was taken by ambulance to the hospital following a grand mal seizure. He went on to have multiple seizures at the hospital, and was transferred to another facility. At first they were calling them febrile seizures until they diagnosed him with epilepsy. The cause of his fever is still unknown, but I believe the vaccines he had on Nov.9 may have caused the fever, and brought on the seizures.

Current Illness:
Preexisting Conditions: Had knee realignment surgery on 11/19/2012. Hypertension.
Allergies:
Diagnostic Lab Data: Flu shot: negative; Blood work for infection: positive
CDC Split Type:
Write-up: On 11/21/2012 woke up with 101.5 temperature. I was able take Tylenol to bring it down, but the fever kept fluctuating between normal and fever. Had nausea, uncontrollable chills, was cold and hot, very sleepy, vomiting, weakness also had loss of appetite. I had had knee surgery on 11/19/2012 for knee realignment. PNEUMOVAX was given to me on 11/20/2012 in my left shoulder. Also Influenza Split injection was given in my right shoulder. I had a rash on my left shoulder that grew from the injection site to the elbow and shoulder that was very sore, red and hot. Started as small and grew. I kept getting worse and On 11/23/2012 woke up with 102.5 temperature and was really sick I was able to get the temperature down with Tylenol but my Dr

advised me to go to the to the emergency room. The ER did test for the flu and came back negative. The Dr also checked my leg for infection and did not see any sign on the incision of infection and said looked really good. Also did blood tests found that came back as had infection somewhere. The ER Dr said she thought I had a infection in my left arm near the injection site and put me on antibiotic. My temperature and side effects went away on 11/25/2012 but the rash remained for another week or so.

Write-up: This spontaneous report as received from a healthcare worker refers to unknown number of patients of unknown age. The unknown number of patients had received ZOSTAVAX (lot number not provided) and VARIVAX (lot number not provided) doses which were exposed to -6.8C for 1.5 hours every 24 hours due to defrost cycle every day. No adverse effect reported. It was unspecified if the patients had sought medical attention. The health care professional contacted during telephone follow-up did not remember which patient might have received these vaccines and could not supply the following information: date of birth, dates of vaccination, or lot number. She also stated that the vaccines have been moved to a proper storage unit. Follow-up information received from the healthcare worker. Patient information was updated. On 05-AUG-2013 the patient was vaccinated with a dose of improperly stored ZOSTAVAX (lot#, expiration date and route not reported). Additional information has been requested.
